

## Beslutningsstøtte ved flytning af lelevkvæg

Af Erik Rattenborg, dyrlæge, ph.d., SEGES Kvæg

Flytning af levedyr mellem kvægbesætninger er den væsentligste årsag til introduktion af smitsomme sygdomme. Kan det helt undgås at indkøbe levedyr til besætningen, er man således fri for denne risiko, og besætningen er kun udsat for smitte fra indirekte kilder. Det er dog langt fra alle besætninger, der kan undgå at indkøbe levedyr, idet knap halvdelen af de danske kvægbesætninger en eller flere gange årligt indkøber dyr.

Dette beslutningsstøtteværktøj er udarbejdet med henblik på at give landmanden et redskab til at vurdere risikoen ved den besætning, der indkøbes dyr fra. Værktøjet placerer kvægbesætninger i kategorier efter deres risiko for smitte ud fra generelle betragtninger.

Værktøjet består af et regneark, hvor CHR-nummeret på alle ejendomme er listet med en række andre variable herunder en 'smittescore'. Jo lavere scoren er, desto mere sikker bør ejendommen være at indkøbe dyr fra. Der er ikke nødvendigvis en lineær sammenhæng mellem tallene.

## Faktorer med indflydelse på risikoen

Risikoen for overførsel af infektion til en besætning ved indkøb af levedyr er influeret af en række faktorer:

- Leverandørens smittestatus
- Antal indkøbte dyr
- Antal leverancer

Leverandørens smittestatus er bestemt ved prævalensen (forekomsten) i leverandørbesætningen på tidspunktet for flytningen.

Sammenhængen mellem risikoen for, at mindst 1 indkøbt dyr er smittet og antallet af indkøbte dyr er

$$p_d = 1 - (1 - \text{præv.})^n,$$

hvor  $p_d$  er risikoen for overførsel, præv. er prævalensen i leverandørbesætningen, og  $n$  er antallet af indkøbte dyr. Indkøbes eksempelvis et enkelt dyr fra en besætning med en prævalens på 0,1 (10 %) er risikoen for, at dyret er smittet 0,1 (10 %). Indkøbes 20 dyr fra besætningen vil risikoen være 0,88, dvs. næsten 90 % for at mindst et af de indkøbte dyr er smittede.

Sammenhængen mellem risikoen for at indkøbe smittede dyr og antallet af leverancer begrundes i, at en transport i sig selv indebærer en risiko (køretøj og chauffør). Den kan beregnes efter samme princip:

$$p_i = 1 - ((1 - p_1)(1 - p_2) \dots (1 - p_n)),$$

hvor  $p_i$  er den samlede 'leverancerisiko', og  $p_1, p_2 \dots p_n$  er de enkelte leverancers risiko. Sidstnævnte parametre vil typisk kunne trækkes fra en fordeling.

## Specifikke infektioner

En lang række af de mest tabvoldende infektioner er udryddet eller forekommer ikke i Danmark. Således er Danmark pt. fri for de sygdomme, som den internationale dyresundhedsorganisations (OIE) vurderer som særligt alvorlige. En række af de mindre alvorlige, men dog af en vis samfundsmæssig betydning, er blevet udryddet eller forekommer heller ikke i Danmark. Nogle af disse er omfattet af offentlige overvågningsprogrammer. Nogle infektioner er under national bekæmpelse, hvor alle kvægbesætninger overvåges for infektionerne, og for nogle infektioner er besætningerne omfattet af screeninger uden, at der decideret er tale om en udryddelsesstrategi.

OIEs særligt alvorlige sygdomme (eksempler)

- Kvægpest (er udryddet overalt i verden)
- Mund- og klovsyge (seneste udbrud i DK i 1983, seneste udbrud i EU i 2007)
- Bluetongue (DK erklæret fri i 2011)

Mindre alvorlige sygdomme, men af en vis betydning

- Kvægtuberkulose
- Brucellose
- Infektøs Bovin Rhinotracheitis (IBR) (seneste tilfælde i DK i 2004)
- Enzootisk Bovin Leukose (EBL)

Sygdomme under udryddelse

- Bovin Virusdiarré (BVD)
- Salmonella Dublin

Sygdomme, der monitoreres nationalt uden en udryddelsesstrategi

- B-streptokokker (malkekvægsbesætninger)
- Infektion med *Mycoplasma bovis* (malkekvægsbesætninger)

Sygdomme, hvor besætninger deltager i frivilligt kontrolprogram

- Paratuberkulose (malkekvægsbesætninger)

Alle ovennævnte sygdomme er udryddet eller omfattet af en form for overvågning eller kontrol, der sætter en køber af levedyr i stand til at undgå infektionen eller indhente information om sandsynligheden kvalitativt for infektion i sælgerbesætningen.

1. De af OIE nævnte særligt alvorlige sygdomme samt mindre alvorlige sygdomme, men af en vis betydning forekommer pt. ikke i Danmark og behøver som sådan i dagligdagen ikke at indgå i en risikovurdering ved indkøb af levedyr.
2. Sygdomme under udryddelse er omfattet af lovgivningen og salg af levedyr fra smittede besætninger er forbudt eller begrænset.
3. For sygdomme, der monitoreres uden udryddelsesstrategi har sælger oplysningspligt, eller køber kan indhente oplysninger fra sælger. For sygdomme med frivilligt kontrolprogram tilrådes kun at købe dyr i henhold til certificeringen.

For 1. gælder som nævnt, at Danmark er erklæret fri og overførsel til en besætning, ved flytning af dyr fra en anden dansk besætning er usandsynlig pt. For 2. og 3. gælder, at selvom man indkøber fra besætninger, der sandsynligvis er fri, er der en lille, men ikke ubetydelig sandsynlighed for at sælgerbesætningen er smittet. Infektionen i sælgerbesætningen kan være introduceret mellem to screeninge, og smitten er ikke opdaget klinisk eller besætningen kan være lavgradig smittet, hvorved sandsynligheden for detektion i overvågningen vil være mindre.

### **Øvrige smitsomme infektioner**

Ud over de specifikke infektioner kan en lang række smitstoffer, virus, bakterier og parasitter forårsage sygdom i kvægbesætninger. Hvis ugunstige forhold er til stede kan infektionerne medføre større akutte eller mere langvarige tab.

Infektioners sygdomsbiologi og epidemiologi er forskellig, og risikoen for overførsel kan derfor kun håndteres ved beregning af generelle overordnede risici.

### **Risikovurdering af leverandøren**

Leverandørbesætningens risiko for specifikke (overvågede) infektioner:

- Kendt status
- Ukendt status
- Prævalens

Leverandørbesætningens risiko for øvrige smitsomme infektioner:

- Kendt status
- Ukendt status
- Prævalens

Hvis man i forbindelse med indkøb af levedyr ønsker at minimere risikoen for overførsel af de førnævnte specifikke infektioner, kan henvises til overvågningen, hvor resultaterne enten kan ses på CHR-registret (Salmonella Dublin-niveau og B-streptokokstatus) eller afkræve sælgeren svar om leverandørbesætningens prøveresultater (*Mycoplasma bovis*

og Paratuberkulose). Ved handel via en bestemt net-portal trækkes oplysninger om sidstnævnte infektioner sammen med andre oplysninger om dyrene og leverandørbesætningen direkte fra kvægdatasen.

For at minimere risikoen for overførsel af øvrige smitsomme infektioner må en generel vurdering af leverandørbesætningens smitterisiko tages i betragtning. I hvor høj grad en leverandørbesætning er smittet, afhænger af:

- Smitte via indkøb af levedyr
- Smitte via andre kontakter til andre besætninger
- Smitte via diffuse kilder

Da antallet af kontakter til andre besætninger ikke er kendt, anvendes besætningsstørrelsen som indirekte mål for denne faktor, idet det generelt er reglen, at større besætninger har hyppigere kontakter end mindre via vognmænd, servicepersonale mv.

Smitte via diffuse kilder omfatter forskellige ikke særligt kontrollerbare smitteveje (luftbåren, gødningsbåren, vektorer, mv.). Da smitten via diffuse kilder ikke kan måles direkte, anvendes kvægtætheden i området som indirekte mål for denne faktor.

### **Materialer og metoder**

Alle data til analysen blev trukket fra kvægdatasen ved Kvæg-IT. Alle nedennævnte vægte er tildelt efter et subjektivt skøn.

Alle flytninger af kvæg mellem ejendomme, både mellem bedrifter og indenfor bedrifter er med i beregningerne. Også leverandørejendom og dato indgik, således at både antallet af leverandører blev beregnet samt antallet af leverancer. Enkelte ejendomme indgår som samlesteder og vil derfor have ganske høj smittescore. På nogle af disse samles kun dyr til eksport, og smittescoren vil derfor ikke være relevant for danske besætnings ejere.

Besætningsstørrelsen for alle besætninger målt den 1. hver måned. Det gennemsnitlige antal dyr på ejendommen for 2015 indgik i beregningerne.

Kvægtætheden blev opgjort som antal kvæg pr. km<sup>2</sup> i postnummergrupper.

For nogle CHR-numrene mangler enkelte eller flere af oplysningerne og en smittescore kunne derved ikke beregnes for disse ejendomme.

Alle beregninger blev foretaget i statistikprogrammet SAS.

### **Tilførte dyr, leverancer og leverandører til ejendommene**

Af 18.378 ejendomme fik 8.961 **ikke** tilført dyr fra andre ejendomme, hvilket udgjorde 49 %. Fordelingen af antallet af tilførte dyr til de 9.417 ejendomme, der fik tilført dyr, fremgår af tabel 1.

Fordelingen af antallet af leverancer samt antallet af leverandører kan ligeledes ses i tabel 1.

*Tabel 1. Fordeling af antallet af tilførte dyr, leverancer og leverandører*

	0 % Min	1 %	5 %	10 %	25 %	50 %	75 %	90 %	95 %	99 %	100 % Ma
Tilførte dyr	1	1	1	1	2	7	53	175	310	869	193
Leverancer	1	1	1	1	1	2	8	23	42	134	44
Leverandører	1	1	1	1	1	1	2	5	7	25	7

Antallet af tilførte dyr, leverancer og leverandører blev tildelt vægte efter værdi-grupper. Vægtene blev multipliceret til en samlet vægt for indgange af dyr. I forhold til faktorerne besætningsstørrelse og kvægtæthed vægtes tilførte dyr temmelig højt.

### Besætningsstørrelser

Fordelingen af det samlede antal dyr på de enkelt ejendomme ses på figur 1.

### Fordeling af besætningsstørrelse

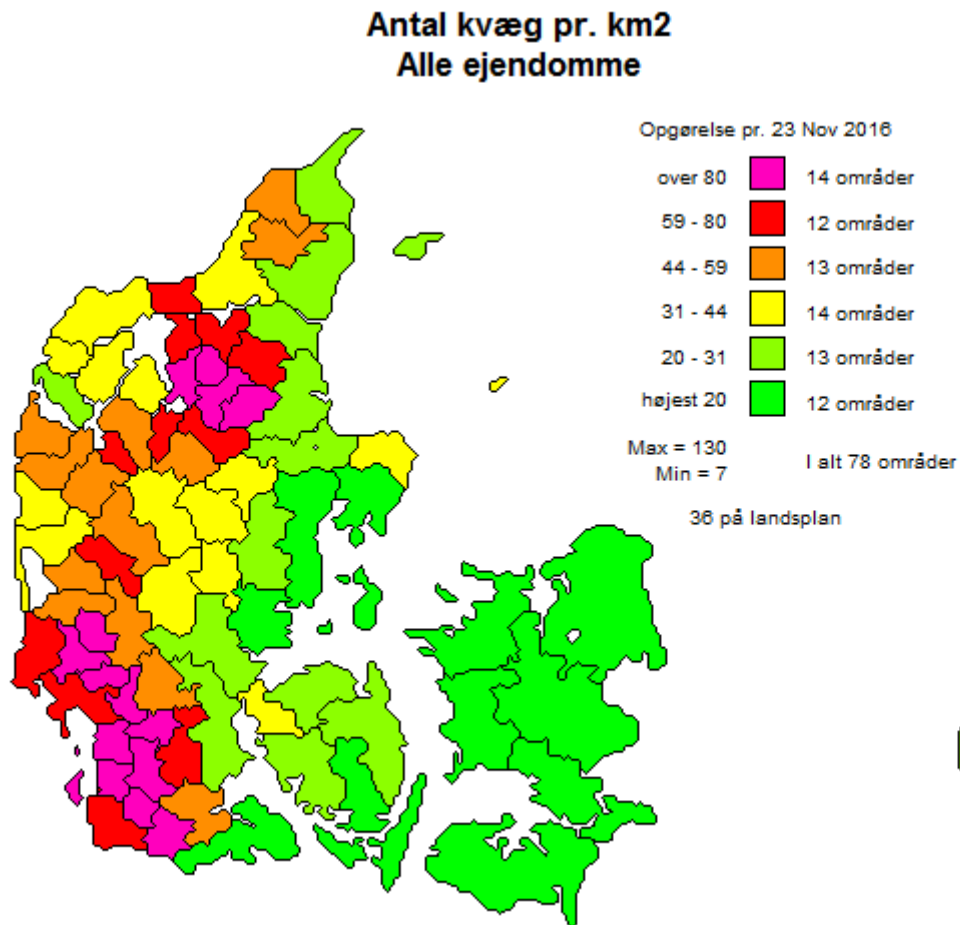

Figur 1. Fordeling af ejendomme efter besætningsstørrelser.

Besætningsstørrelserne inddeltes i grupper, der blev tildelt vægte. Vægten for besætningsstørrelsen blev adderet den samlede vægt for tilførsel af dyr.

#### Kvægtæthed

Den geografiske fordeling af kvægtæthed opgjort pr. november 2016 ses på figur 2. Tætheden er opgjort i grupper af postnumre. Ejendommens placering i en postnummer-gruppe blev vægtet efter tætheden som anført på kortet.

Figur 2. Tætheden af kvæg i forskellige postnummergrupper målt som antal dyr pr. km<sup>2</sup>

Vægten for kvægtæthed blev adderet vægtene for besætningsstørrelse og den samlede flyttevægt til en samlet smittescore.

### Resultater

Alle ejendommers smittescore blev beregnet. Resultaterne kan findes i Excel-filen ' smittescore CHR-numre 2015', som er tilgængeligt for opslag. Figur 3 viser fordelingen af smittescorene.

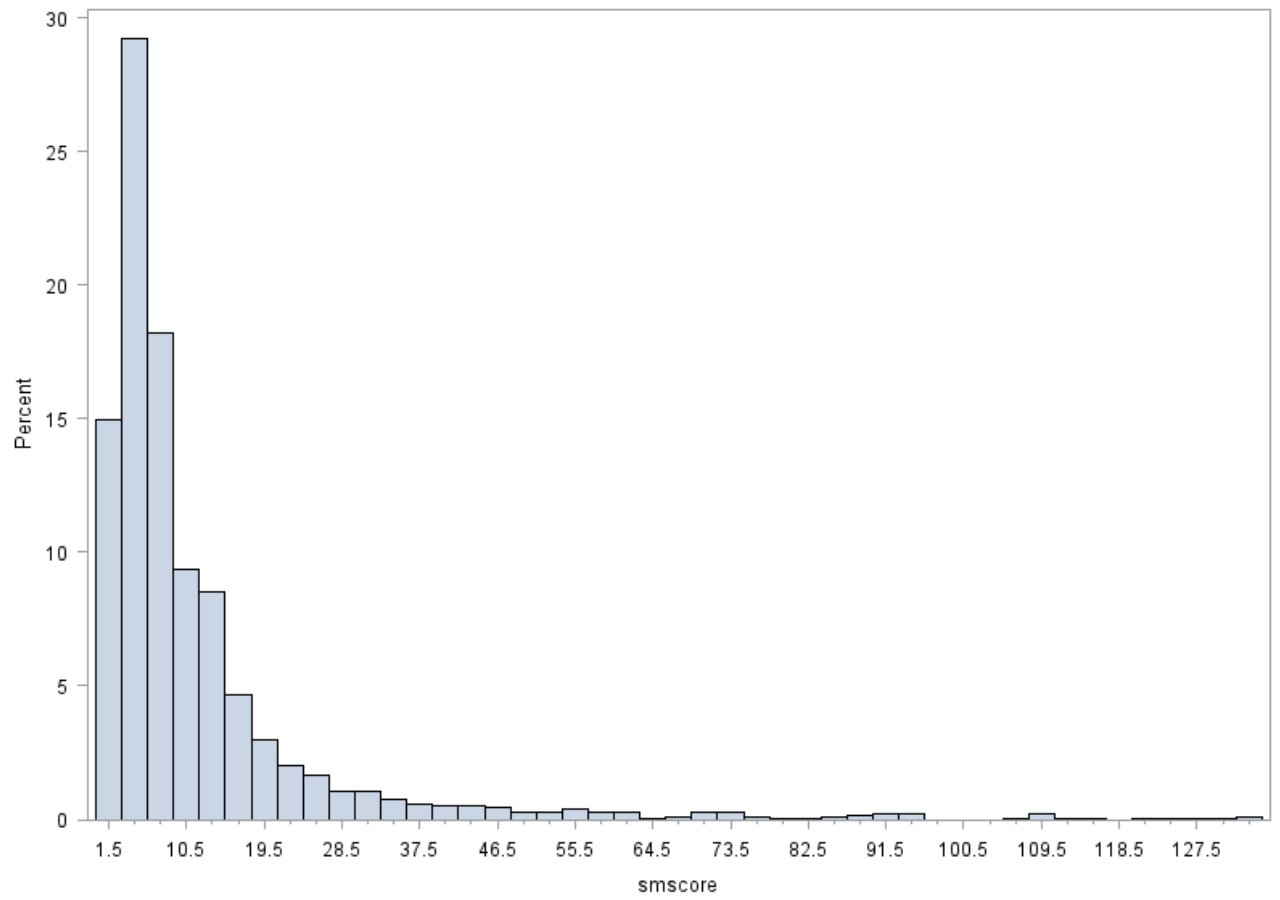

### Diskussion

Smittescore for samtlige ejendomme med kvæg i Danmark er beregnet. Scorerne giver et fingerpeg om en forholdsvis størrelsesorden af risikoen for indførsel af smitte med smitsomme infektioner som følge af ukendt smittestatus. De enkelte scorers indbyrdes forhold er ikke nødvendigvis lineær og må derfor tages med et vist forbehold. Vægtene, der indgår i scoren er subjektivt vurderet med hovedvægt på smitterisikoen ved tilførsel af levedyr. Vægtene kan relativt nemt justeres ved opnåelse af ny viden om smitemæssige forhold samt ændringer i de ejendomsmæssige faktorer.

### Fordeling af smittescore

Figur 3. Fordeling af smittescore for danske kvægbesætninger
