## Breeding of Grain legumes at NPZ with a focus on winter faba beans

Wir lassen Qualität wachsen

LEMBKE

Finn Holmgard, Olaf Sass Norddeutsche Pflanzenzucht

Hans-Georg Lembke KG Workshop on organic pulses **Copenhagen, 28<sup>th</sup> October 2013** 

- Family owned breeding company with 2 stations in Hohenlieth and Malchow
- 210 coworkers
- Plant breeding since 1897
- Crops: Winter Rapeseed, Spring Rapeseed, Fababeans, Combining peas, Fodder Grasses, Red Clover
- Red clover breeding since seit 1955
- Faba bean breeding since 1980
- Pea breeding since 2005
- Partnership with RAGT/ FR in breeding of grain legumes since 2009

Wir lassen Qualität wachsen

LEMBKE

#### Some milestones in grain legume breeding at NPZ

- Start of spring faba bean breeding in 1980
- Start of winter faba bean breeding in 1980, stopping of these activities in 1984 due to complete loss of the nursery
- Restart of winter bean activities in 1999 on a low level because of new germplasm availability and research at University of Göttingen (Prof. W. Link)
- Representation of Grain pea varieties in Germany of various partners, mainly Serasem/FR since the 1980ies
- Begin of pea breeding on the base of the program of SWS GbR in 2005
- Enlargement of pea activities by continuing the pea program of Toft A/S, Denmark in 2006
- Start of closer interaction with RAGT/ FR in breeding of grain legumes since 2009

#### Portfolio of NPZ and RAGT in breeding of grain legumes

- sowing time is mainly determined by soil and weather conditions, still unsure which is the optimal stadium for overwintering
- Winter damage occurs mostly at the end of winter/beginning of spring
- Snow cover is tolerated and appreciated
- There is a certain risk of loosing the crop: 3 failures within 12 years - this is higher than what is known from UK where there is hardly any winter loss
- Winter beans can yield significantly more than spring beans : especially in dry summers (not outlined here in detail)
- Hiverna is still the benchmark with respect to winter hardiness

- Proper testing on the "continent" is still a challenge: as soon as you loose some genotypes during winter the yield data are very hard to interpret
- Winter hardy germplasm is on the way : research at University of Göttingen , at INRA/France
  - There is potential that this is higher than HIVERNA
- Open questions: can this be combined with high yield potential <u>plus</u> with enhanced agronomic features (stem stiffness)
- - this needs quite some breeding input
- How can this be achieved for "new" and small crop like winter bean
  The critical input: Breeding is very low

Wir lassen Qualität wachsen

LEMBKE

- How will the markets for Grain legumes in Europe develop?
- - there is not much light at the end of the tunnel

# Thank you very much for your attention !
