

Climate tool project

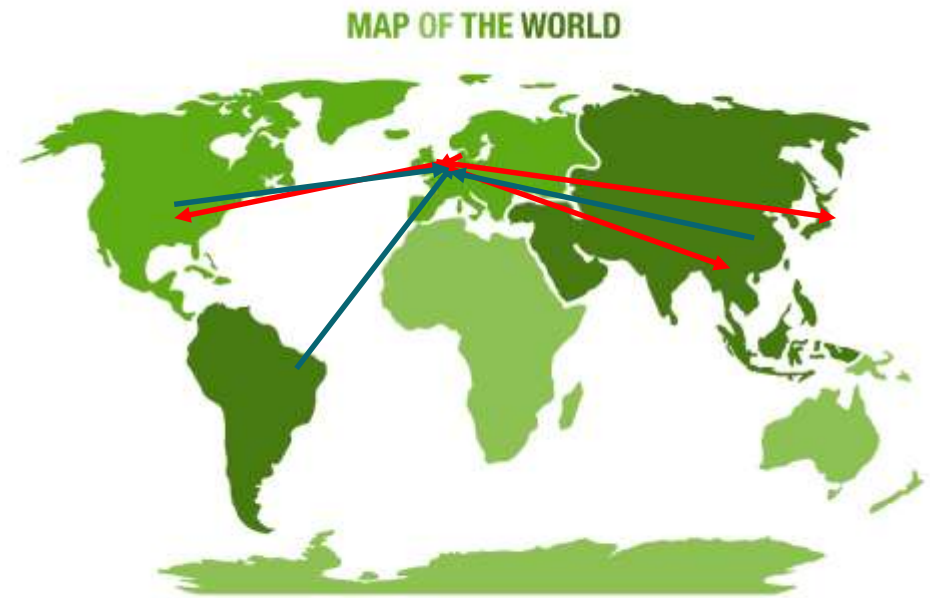

24 March 2020

SEGES

STØTTET AF
Promilleafgiftsfonden for landbrug

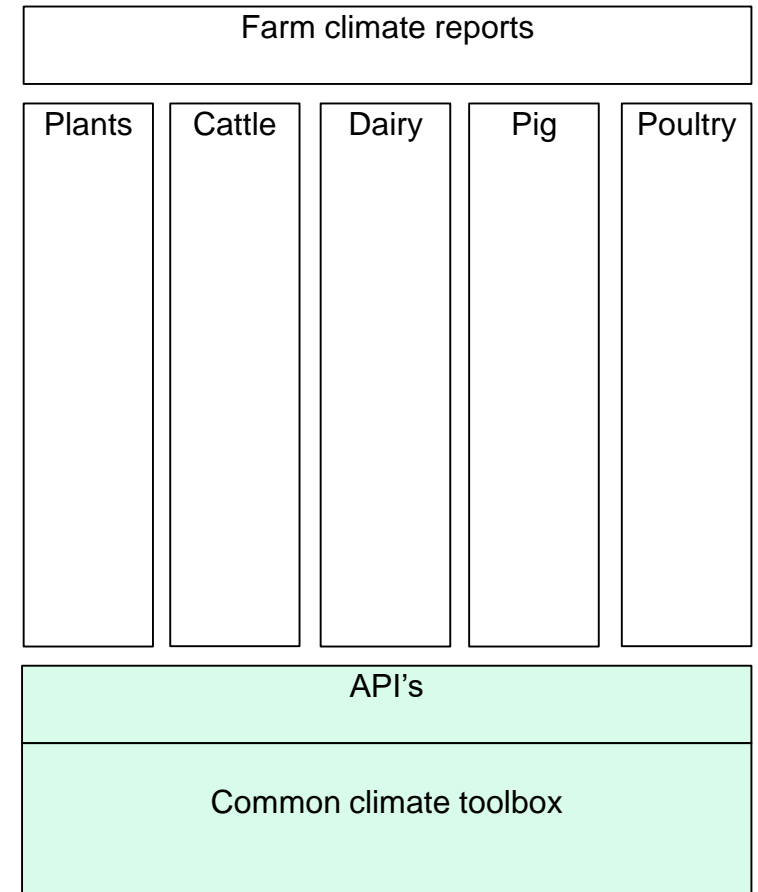

Several ways to calculate the climate impact

PAF call for development of Climate tool

- PAF call on 7.6 million DKK for development of a tool for farm level climate accounts.
- Research and development of a concept for reliable and transparent calculations of climate effects at farm level and research and development of consultancy services for the farms as well as test of the tool and the consultancy concept on selected farms.
- The concept shall calculate the climate impact of farms and allow farmers a solid basis for evaluating possible actions concerning climate friendly production – ecologists as well as conventional farmers of relevant production types.

The Agriculture's Climate Tool (SEGES/ØL)

- The purpose of the climate tool is to:
 - Boost the individual herd's knowledge of the production's environmental consequences
 - Give the individual herd the possibility to assess which initiatives to carry out in order to reduce the climate impact
- A user-friendly climate tool to calculate climate results on herd level will be developed
 - Forms the basis of completing a climate action plan that contributes to initiatives in the specific herds
 - Prototype primo 2021 – operation ultimo 2021
- In order to calculate net emission, the used methods of calculation are similar to the national Danish methods in force at the time in question (IPCC/UN standards) and the PEF method (product environmental footprint), which focuses on life cycle assessments on product level

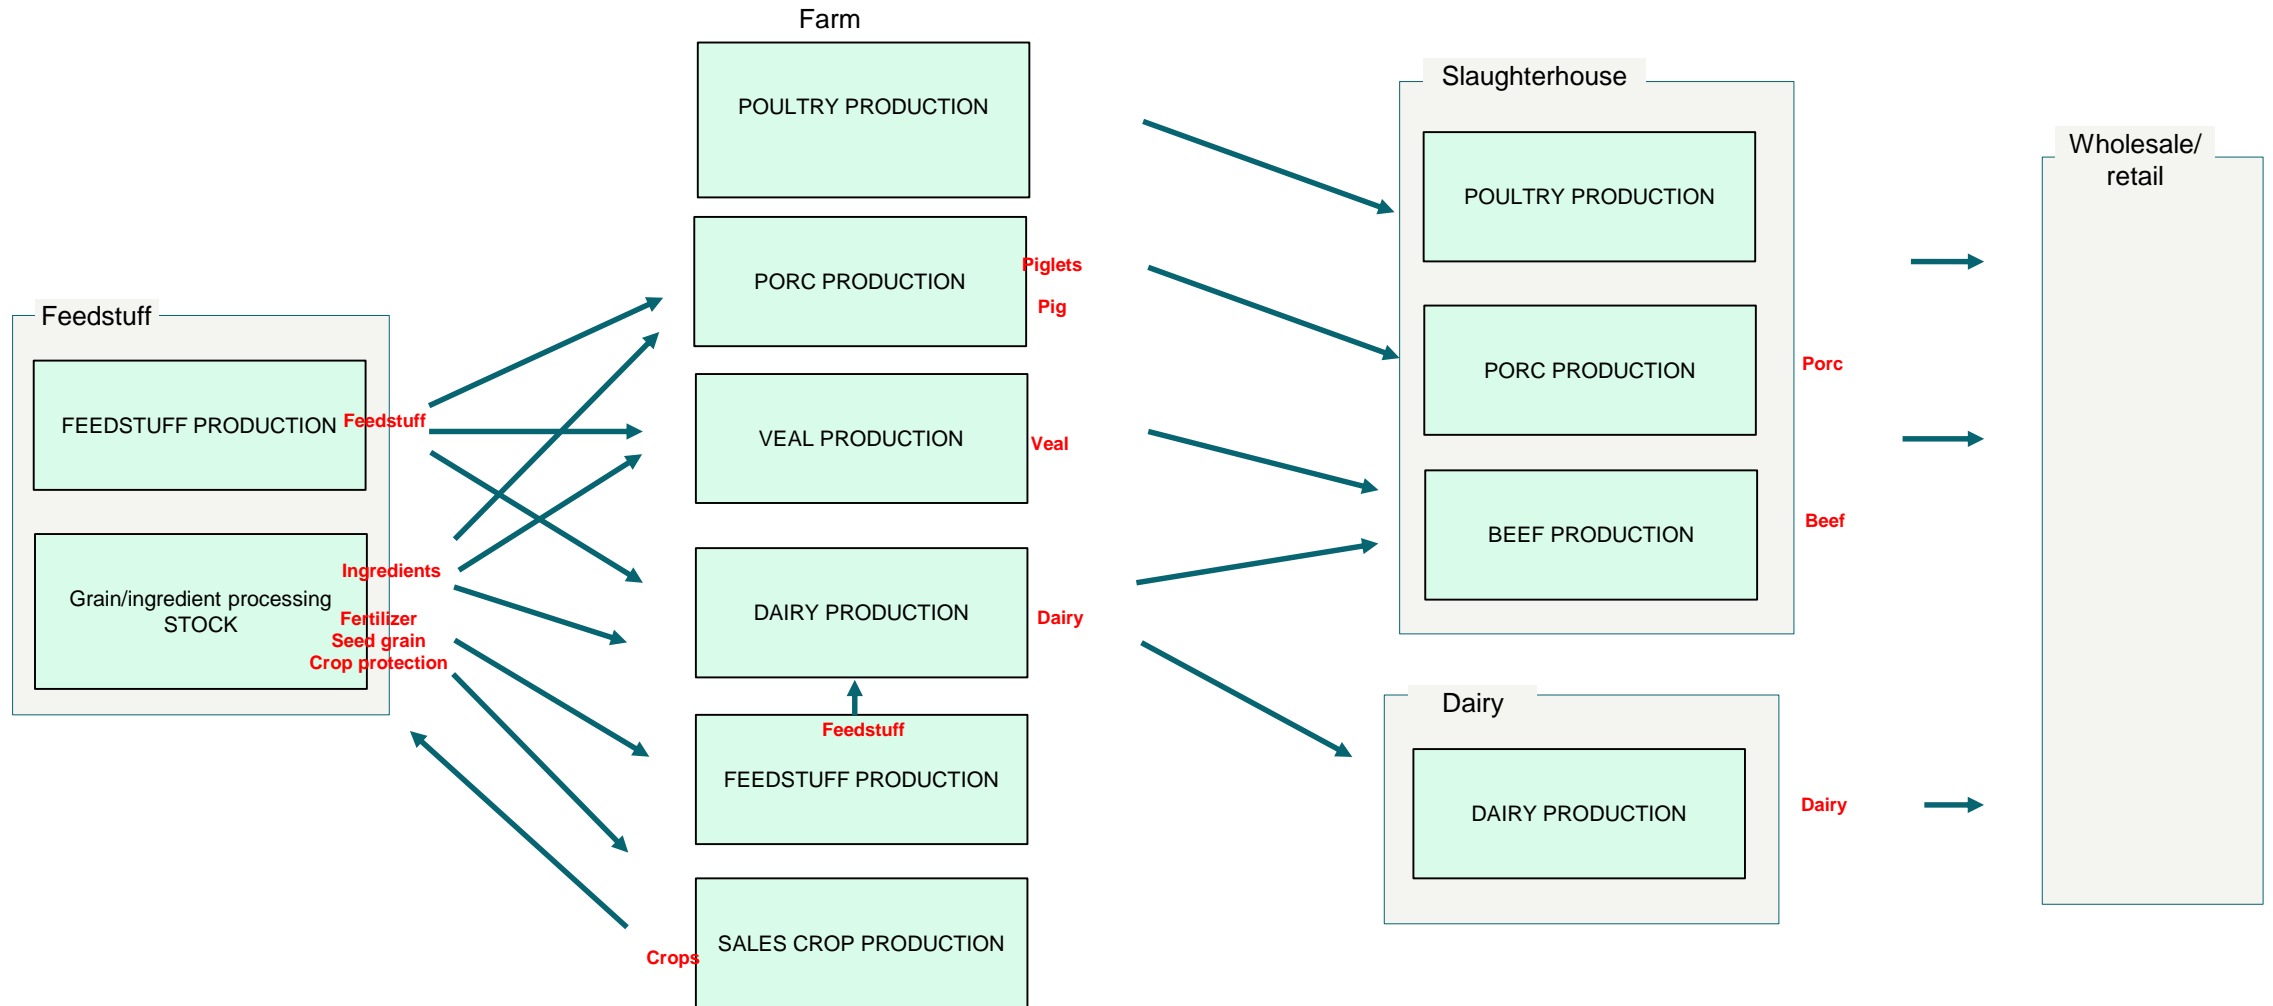

Cooperations

- Aarhus University, DCE – Danish Centre For Environment And Energy
- Aarhus University, AGRO, Department of Agroecology
- Local Consultants
- Farmer panel (supplier for HK Scan)
- Business panel (HK Scan)

5 million DKK for farm level climate accounts

- The parties to the agreement have agreed to allocate DKK 5 million in 2021 for the development of farm level climate accounts that will contribute to a better regulation of greenhouse gas emissions from agriculture
- The funding will support and supplement an already existing joint project by SEGES and Økologisk Landsforening in which we are developing a concept of farm level climate accounts and information – the project is funded by the Ministry of Environment and Food of Denmark
- - We already have a well-functioning regulation basis for the regulation of nitrogen at farm level – our fertiliser accounting system. But we need a basis on which we can regulate climate emission and absorption.

Overview stakeholders / products / chain

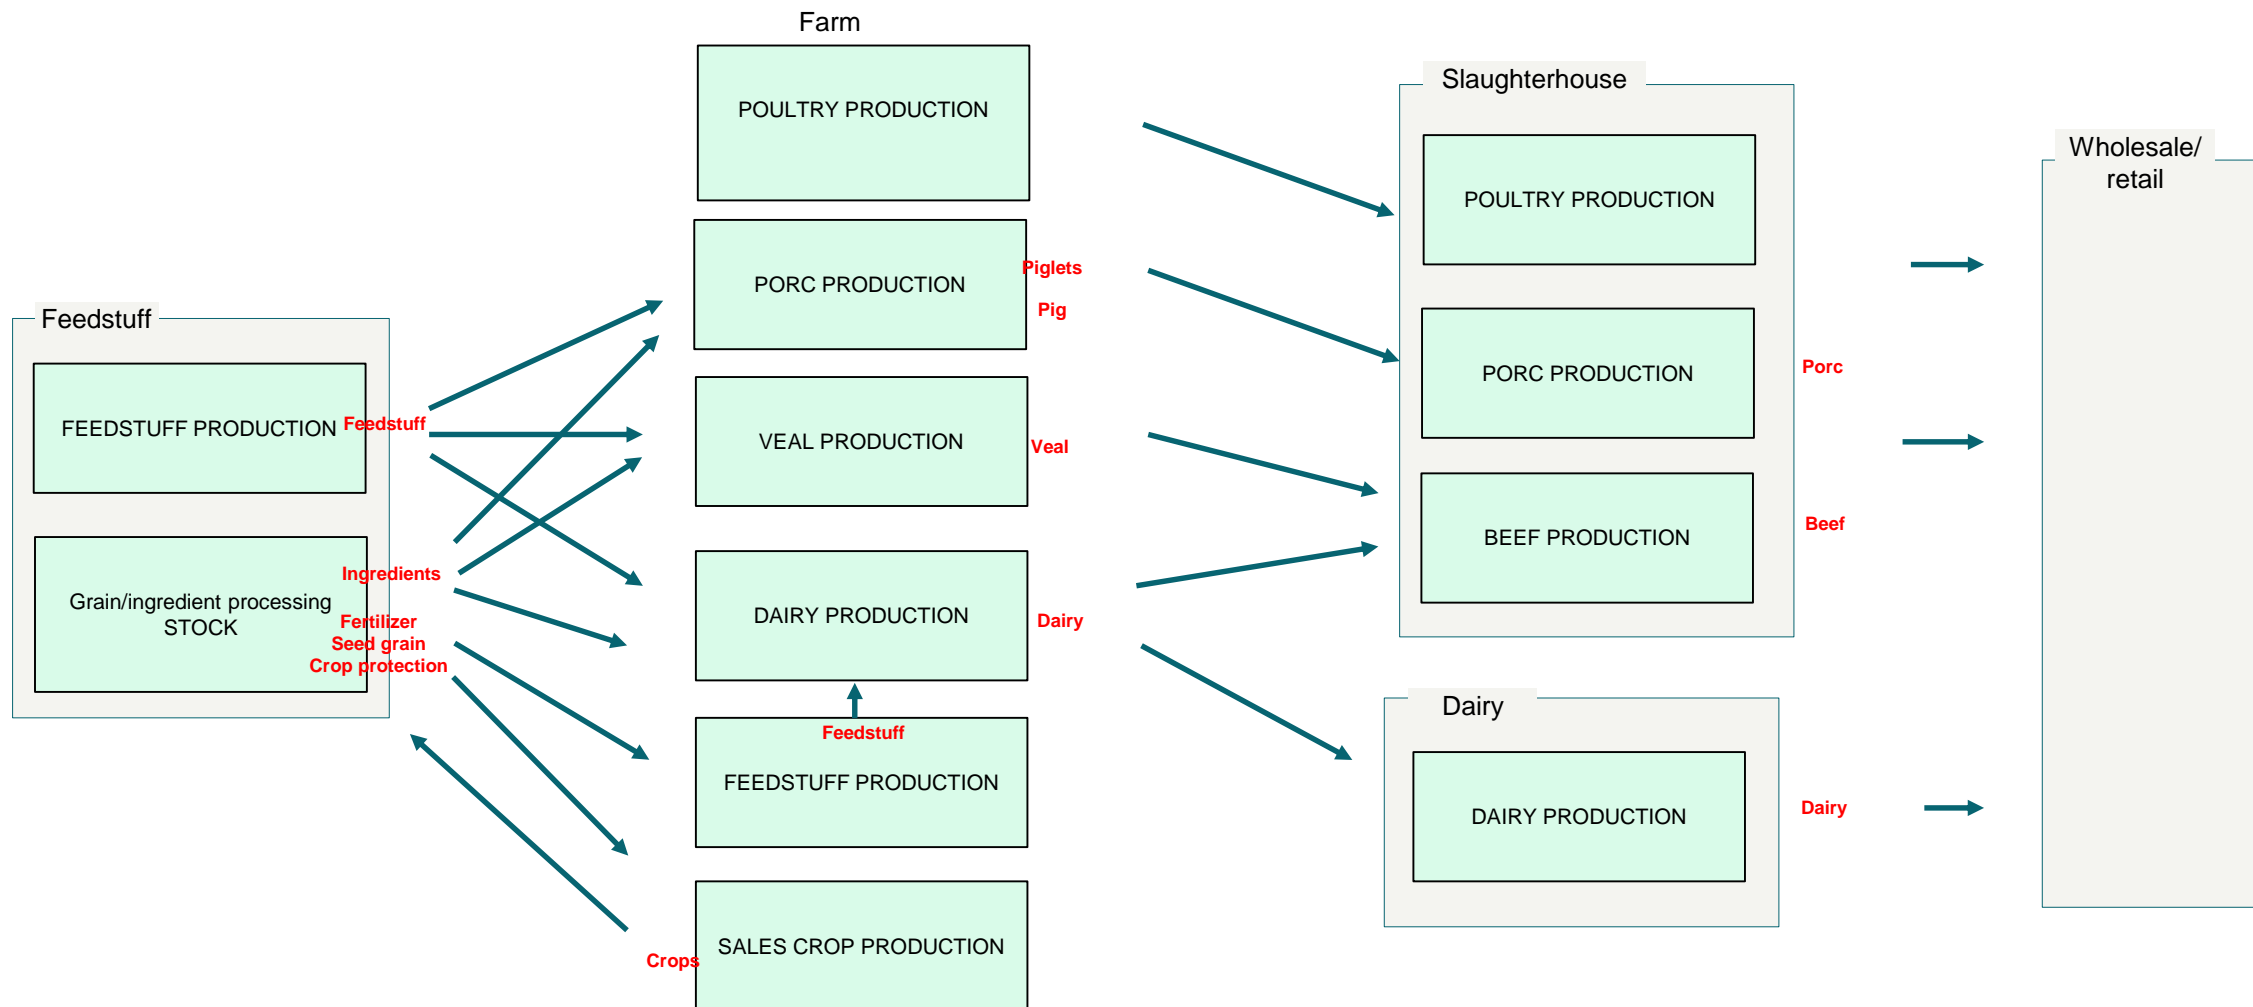

Climate impact calculation in a PEF mind-set (product focus)

Assumption 1: In principle, climate impact measurements should be possible for all the green boxes separately - and/or for the full up-stream chain?

Assumption 2: Each calculation demands: A model, collected data (incl. production scale) and/or access to norm data for the factors in the model

Assumption 3: The calculated climate impact per product (red elements) shall/can be available for the next part of the chain as they represent the input factors for calculations

Formulas – calculation of climate impact of slaughter pigs

Piglets

Feedstuff

Energy

Stable emission

Environmental technology

*Manure
management*

(No. of piglets X CO₂e per piglet) + (total feedstuff X CO₂e per kg feedstuff) + (no. of prod. pigs X kwh per prod. pig X CO₂e per kwh) + (no. of prod. pigs X CO₂e per styplace) + (no. of prod. pigs X CO₂e per pig) + (no. of prod. pigs X CO₂e per pig)

Number of produced pigs

Black values = based on data registered on the farm

Red values = based on farm specific calculated data or calculated standard values/country averages

Blue values = acknowledged norm values for climate impact

Relevant data in the common toolbox

- Norm data, eg. emission factors used in PEF calculations
- Standard values (eg. country averages) used in PEF calculations
- Climate declarations for input factors used at the farms – (eg. feedstuff formulas from feedstuff companies)
- Documentation of calculation methods (PEF calculations)
- Instruments and their impact

Supported by the necessary technical interfaces (API's) as well as security and user management
