1987: The „Brundtland report“

“A development that meets the needs of the present without compromising the ability of future generations to meet their own needs.“

World Commission on Environment and Development (WCED),
in its report “Our common future”, 1987

Trade-off: Environment-Development

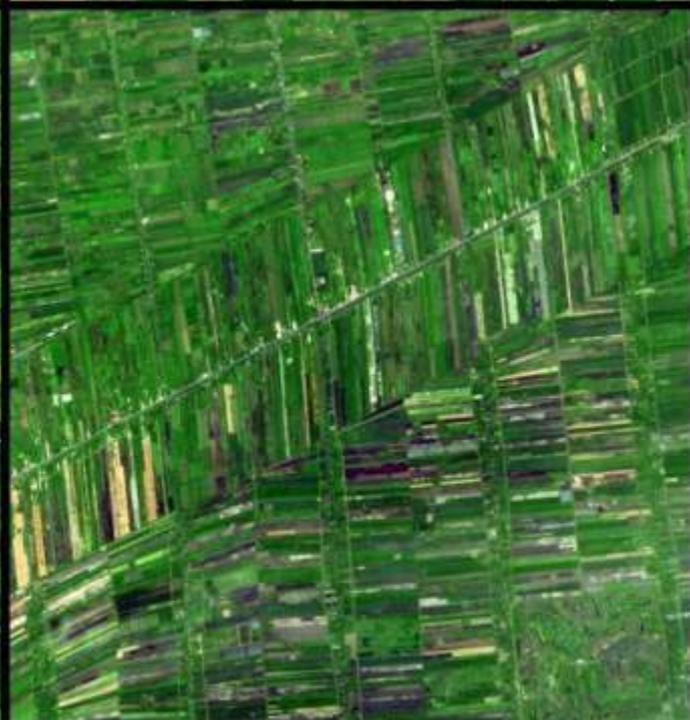

Tradeoffs... substitution is possible, but for how long?

Sustainable development in a nutshell

- o denotes a desired process of societal change
- o is based on the perception of „natural limits to growth“, yet remains a deeply anthropocentric vision. Therefore, sustainable development is about dealing with trade-offs.
- o is about intra- and intergenerational justice
- o adopts a long-term, holistic (multi-dimensional) world view, hence it is also about facing trade-offs
- o is not a scientific, unequivocally defined term, but a normative principle (like e.g. justice)

RISE 2.0: approach and philosophy

Michael Schoch
Scientific Collaborator
Bern University of Applied Science
michael.schoch@bfh.ch

What is RISE*?

*Response-Inducing Sustainability Evaluation

- A method facilitating a rapid and holistic evaluation and communication of the sustainability of agricultural production at the farm level,
- Attempting to make sustainability better comprehensible, tangible and measurable
- An ensemble of indicator system, science-based algorithms, database and software

“RISE is like a mirror of my farm.” (a farmer)

“RISE is my key to the farm” (farm advisor)

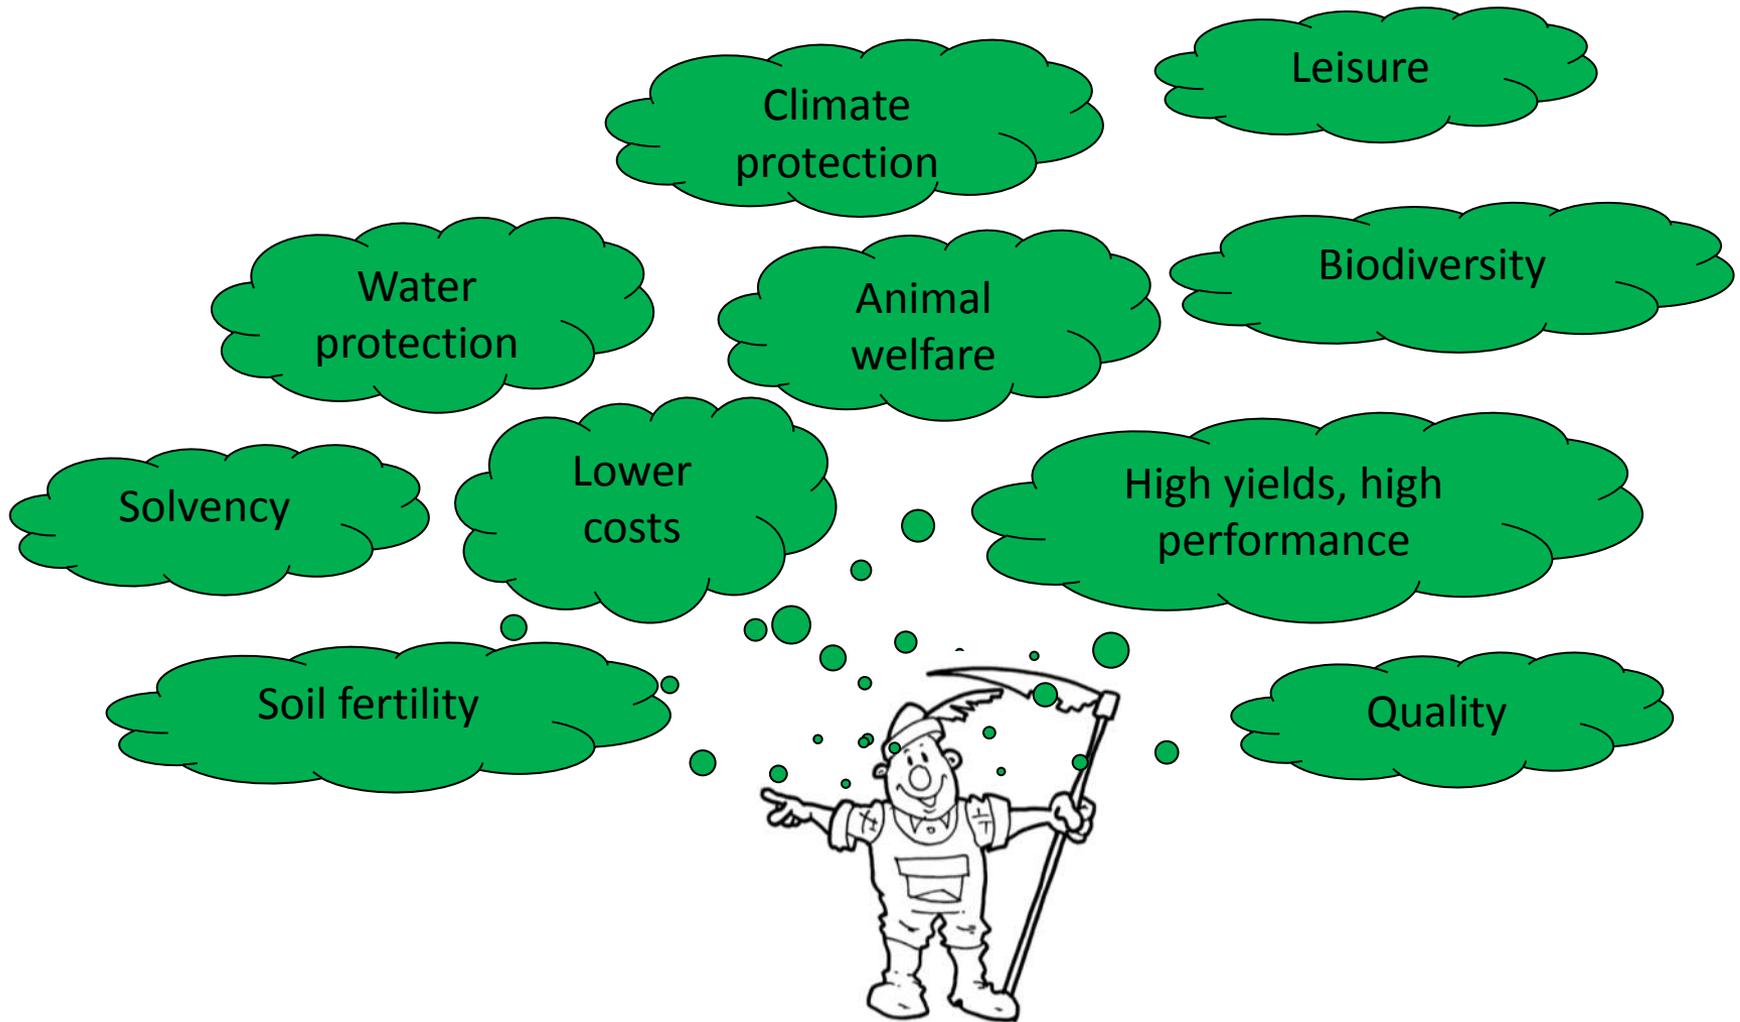

„RISE conveys the idea of sustainability to farmers.“ (an official of the Swiss Federal Office of Agriculture)

Bridging the gap between science / food industry / consumers and application

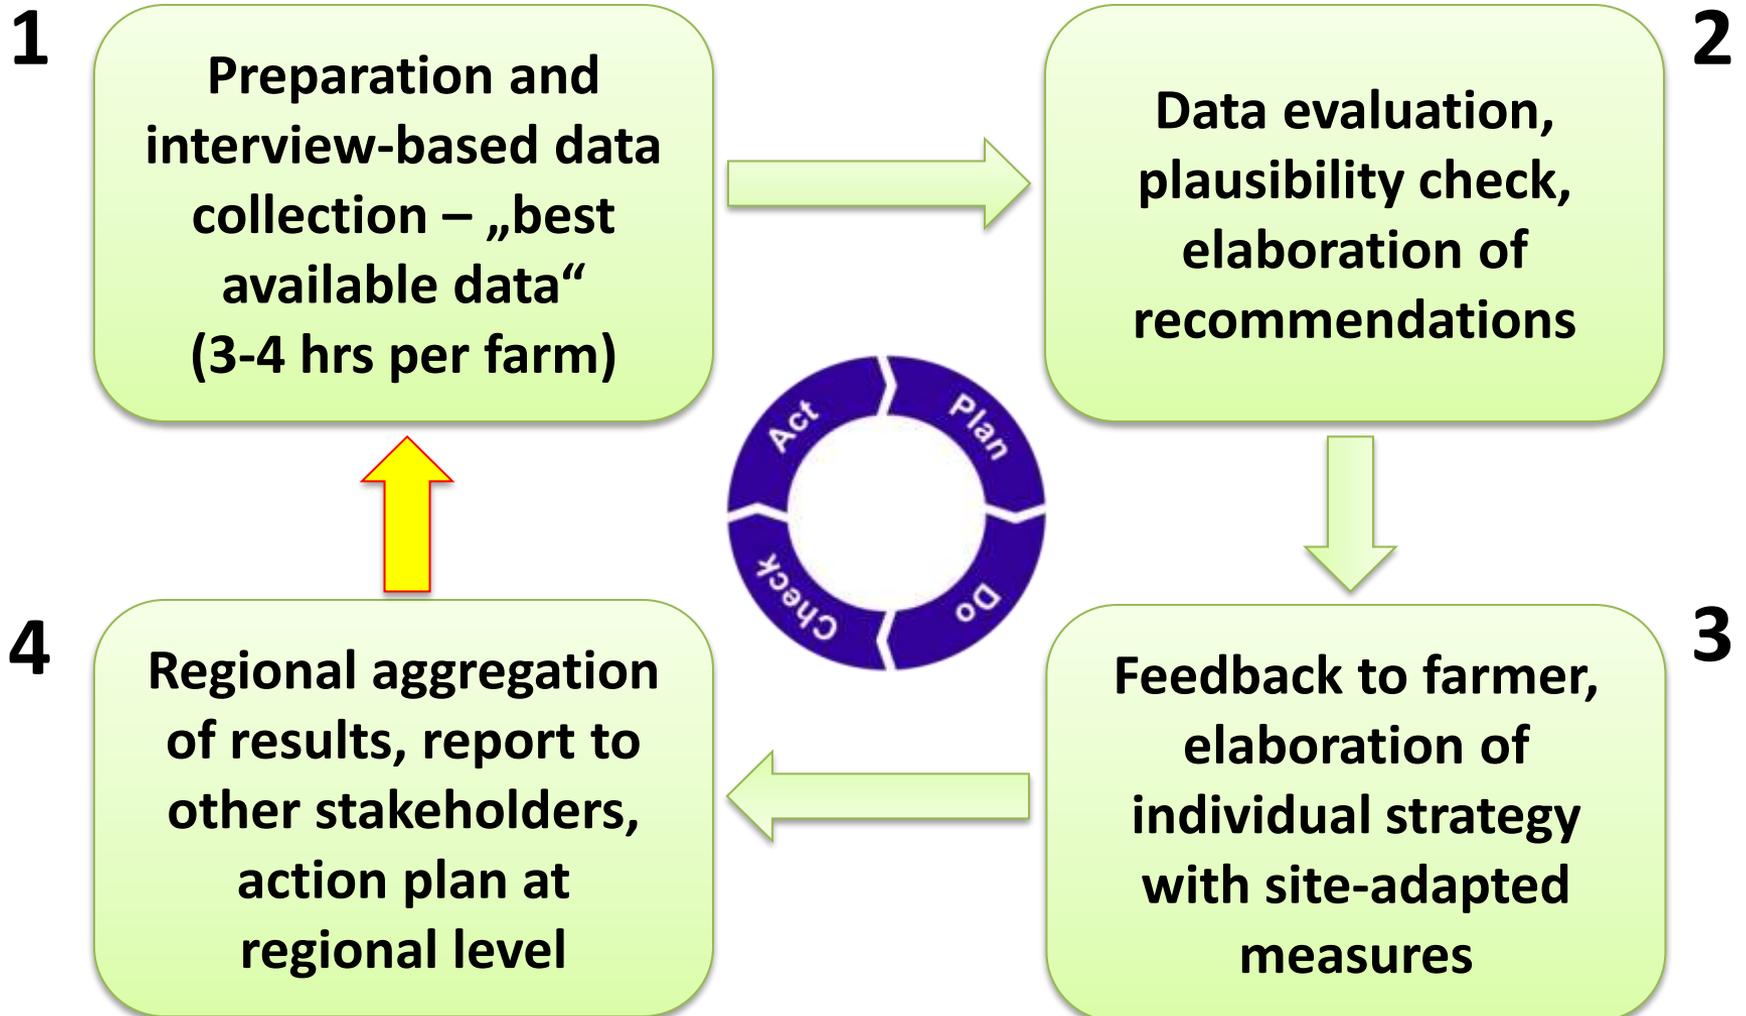

Farmers
need science-based
yet applicable
sustainable production
systems

Food industry and science
need scientific knowledge on
effects of production
practices
Consumers
ask for sustainable food

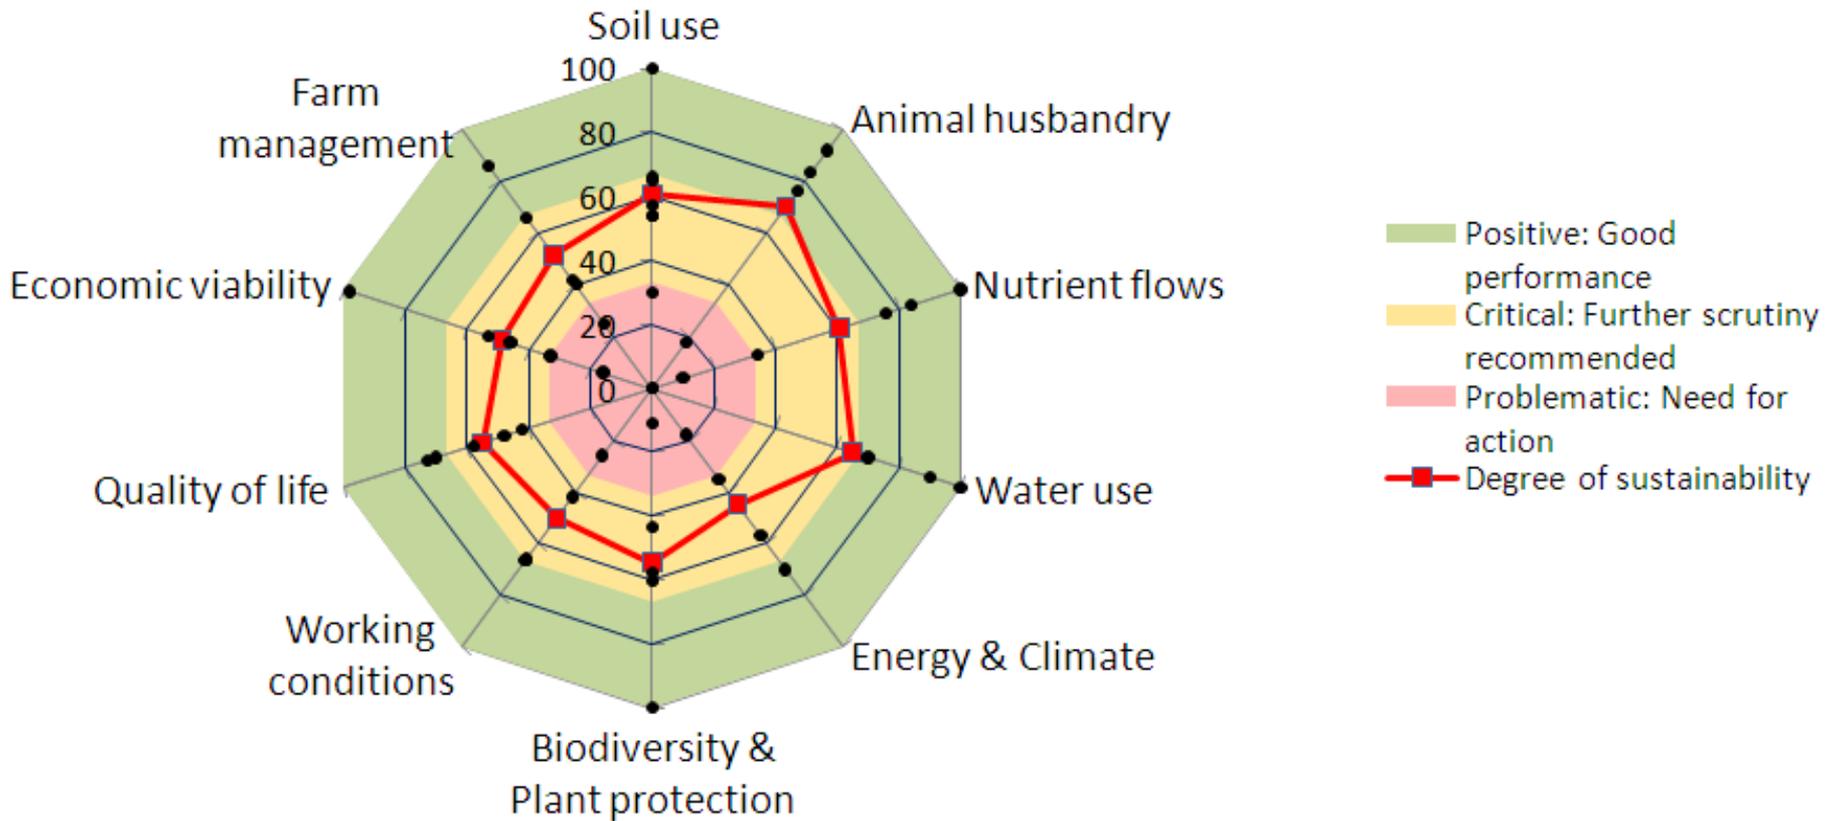

What is relevant? What has priority?
How to bring sustainability „down to Earth“?

Steps of the RISE process

The RISE 2.0 polygon (Swiss farm)

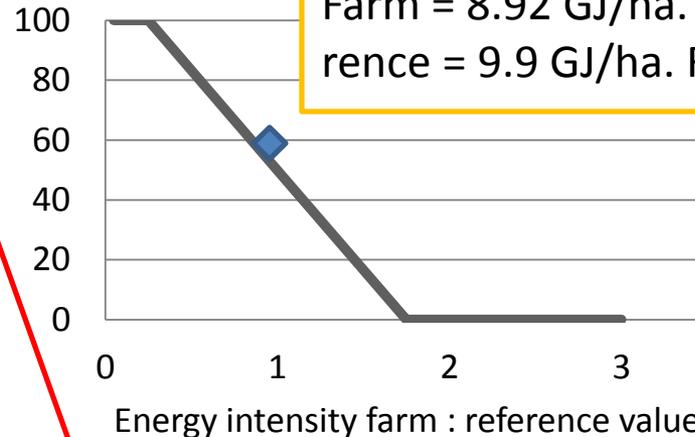

A closer look at parameter scores

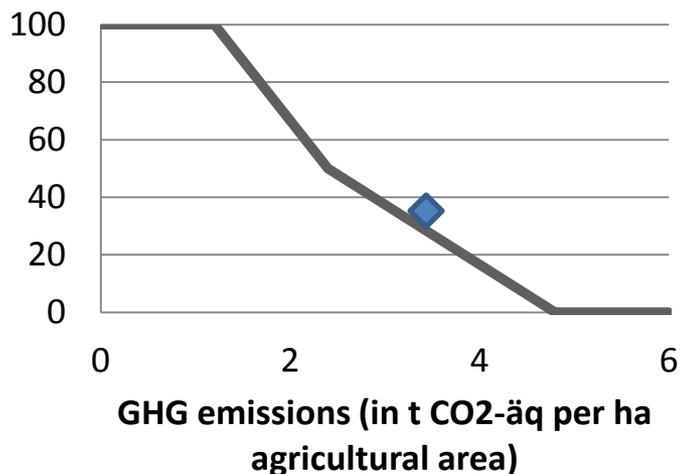

5.1	Energy management	70
5.2	Energy intensity of agricultural production	57
5.3	Share of sustainable energy carriers	18
5.4	Greenhouse gas balance	35

Farmer tracks energy use, diverse energy saving measures: direct seeding of some crops, use of slow power take-off etc.

Farm = 8.92 GJ/ha. CH reference = 9.9 GJ/ha. Ratio = 0.9.

Total energy use = 156 GJ. Sustainable = 28.1 GJ (Swiss Hydropower). Ratio = 18%.

Farm = 3.54 t CO_{2-eq}/ha. Global reference = 2.4 t CO_{2-eq}/ha. 54% of GHG from livestock, 46% from fuel combustion

From smallholdings in Kenya, Ivory Coast, Columbia...

...to dairy farms in the Swiss mountains, in China and Canada ...

... from tea plantations in India, to coffee plantations in Brazil.
