# The challenges in many herds

All calls for focus on gilt rearing and gilt management...

The proportion  
of young sows  
culled

Variation in  
numbers of  
gilts per batch

Pen capacity for  
gilts

Results in first  
parity

Overall herd  
performance

# Agenda

Feeding during the rearing period

Introduction to the breeding unit

Flushing before first service

How do you make a difference?

Summary

# Gilts should not be fed as slaughter pigs

Less focus on gain and feed conversion rate is needed

Weight interval	30-110 kg	30-65 kg	65-110 kg	>110 kg
MJ NE/kg feed	9.5	9.7	9.5	9.5
FUsow/kg feed	1.05	1.06	1.05	1.05
SID protein, g/kg	105	125	105	100
SID lysin, g/kg	<b>6.3</b>	<b>8.2</b>	<b>5.3</b>	<b>4.2</b>
Digestible phosphorous, g/kg	2.6	3.2	2.4	2.1
Calcium (150-250% phytase <sup>1</sup> ), g/kg	<b>6.9</b>	<b>7.7</b>	<b>6.5</b>	<b>6.3</b>

<sup>1</sup> 150-150 % phytase in the Danish Feed Evaluation system is equal to:

Natuphos: 750-1.000 FTU/kg; Phyzyme XP: 750-1.000 FTU/kg) Rono HiPhos: 750-1.000 FYT/kg;  
Ronozyme NP: 1.875-2.500 FYT/kg; Optiphos: 1.005-1.340 FTU/kg; Axtra Phy: 450-600 FTU/kg;  
Quantum blue: 600-800 FTU/kg; Natuphos E: 525-700 FTU/kg.

Source: DanBred Manual (2020)

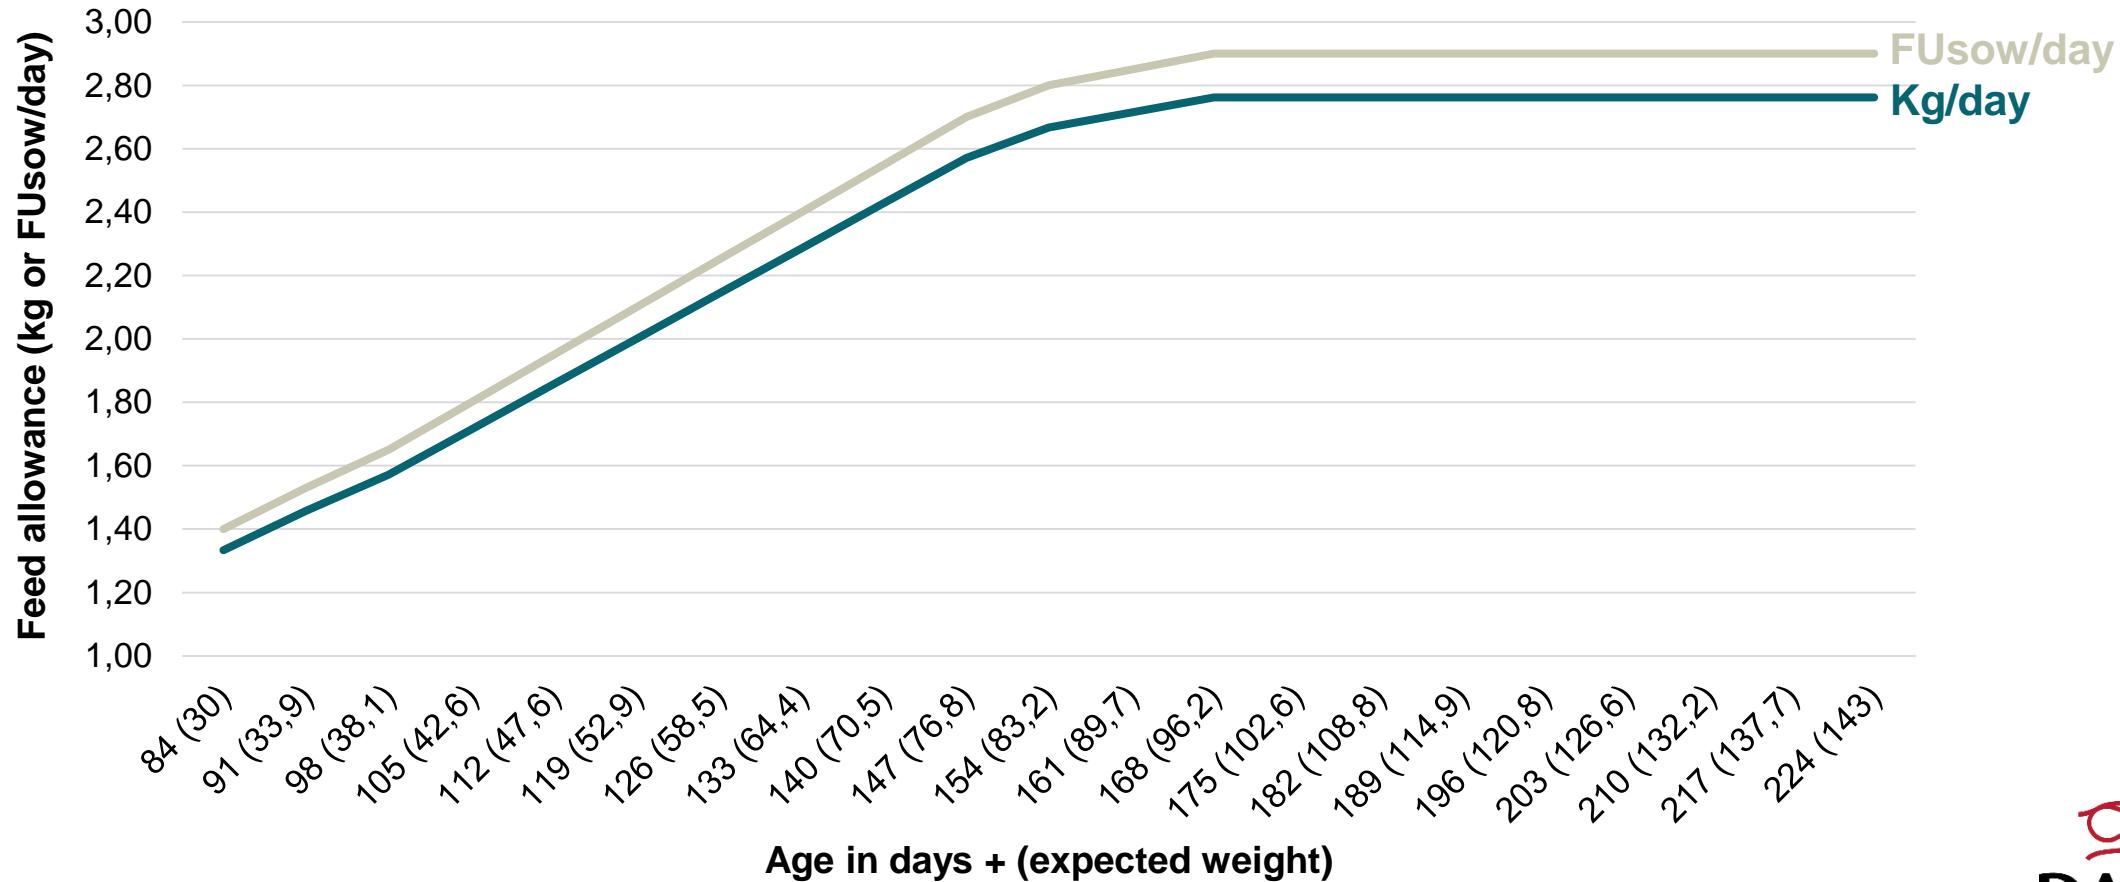

# Special focus on bone development and mineralization

## Calcium, phosphorous, vitamin D and vitamin K

- Follow the recommended levels of all nutrients
  - Use phytase
  - Avoid excess calcium and correct for phytase inclusion
- Use 500-800 IU of vitamin D/kg during the growing phase
  - Use of Hy-D has been shown to decrease bone strength\*
  - If Hy-D is included we recommend not to use the highest dosage
  - The highest dose of Hy-D (50 µg/kg) can decrease calcium content of bones\*
  - Further research will be conducted in 2021 looking at vitamin D/Hy-D/calcium
- Add 4 mg vitamin K<sub>3</sub> per kg of feed
  - Vitamin K is of importance when storing calcium in bones

# Recommended feeding curve for DanBred gilts

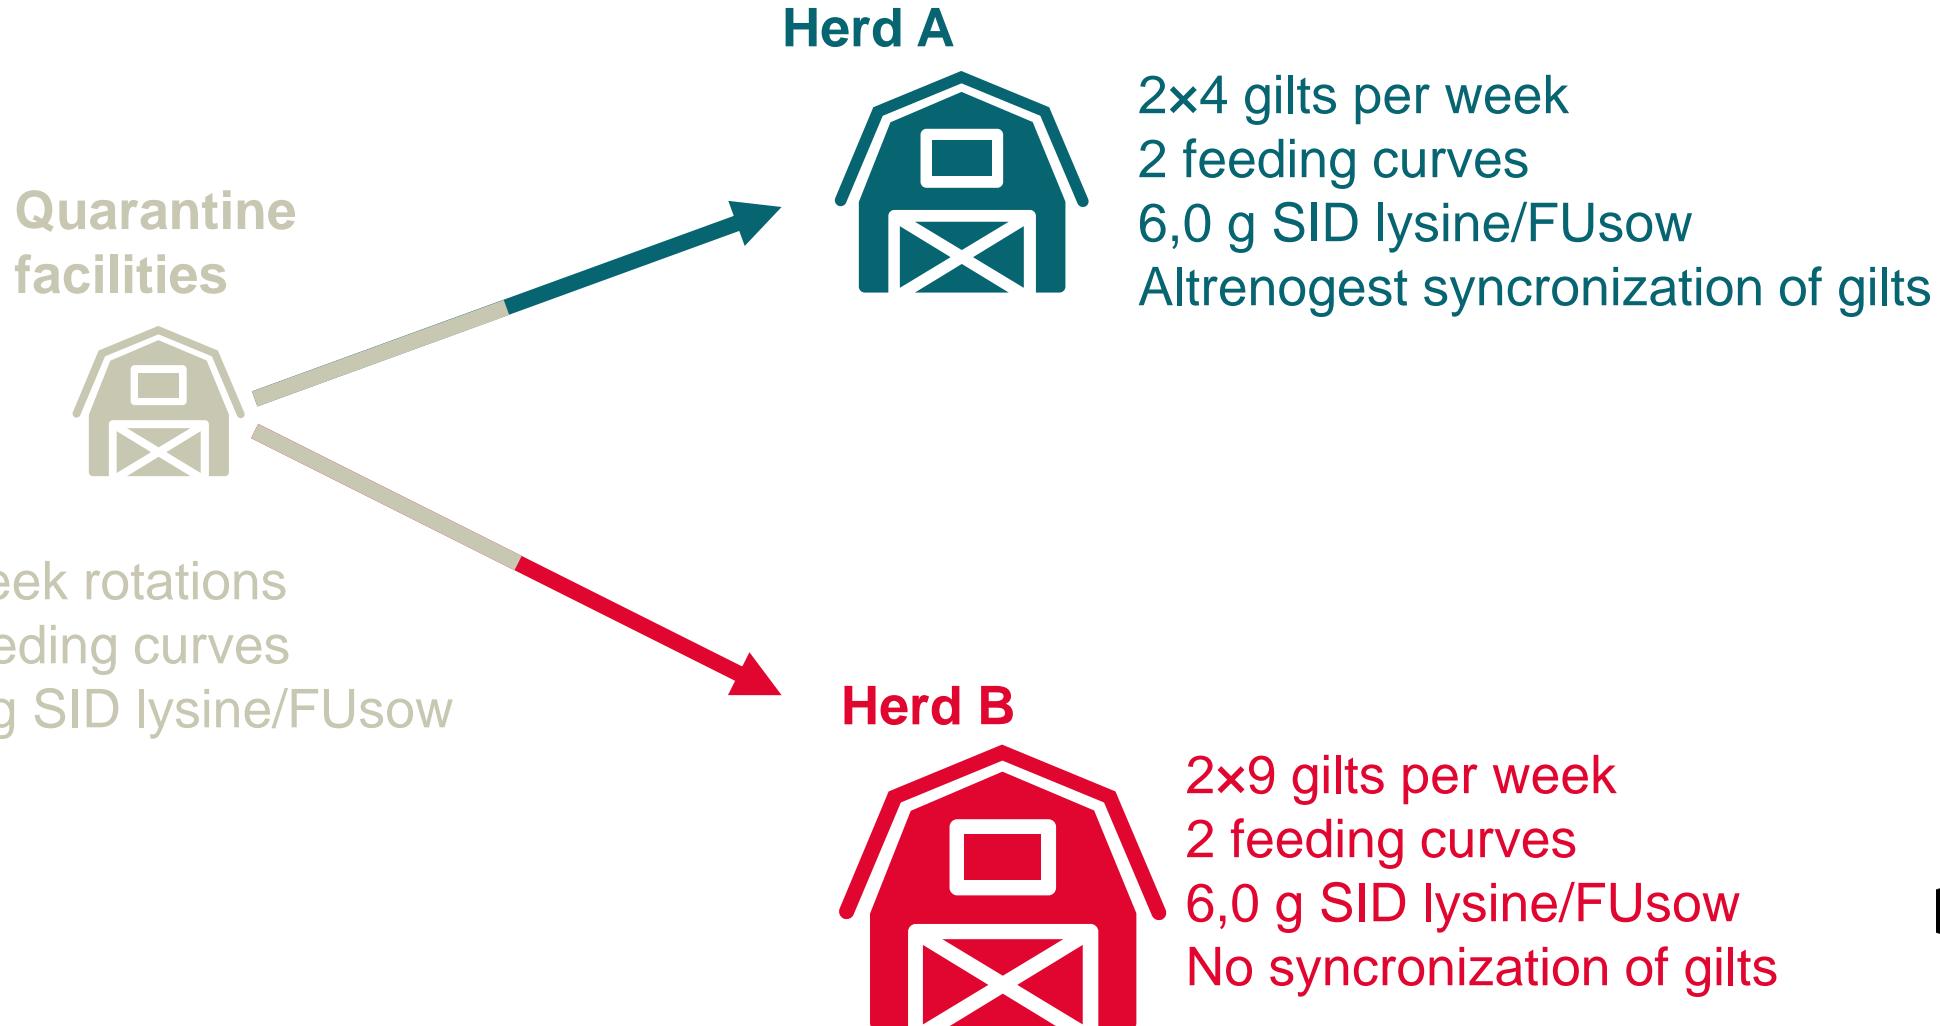

## Aiming for a daily gain around 800 g/day

Kontrol      Forsøg

# Main findings in a trial with >1400 DanBred Hybrid gilts

## Results from first service

Herd A

Feeding curve	Normal	High
Age, days	233	232
Weight, kg	150 <sup>a</sup>	156 <sup>b</sup>
Back fat, mm	13.5 <sup>a</sup>	14.4 <sup>b</sup>

Herd B

Feeding curve	Normal	High
Age, days	238	237
Weight, kg	161 <sup>a</sup>	166 <sup>b</sup>
Back fat, mm	14.0 <sup>a</sup>	14.9 <sup>b</sup>

<sup>a, b</sup> Within a row, values without common superscript letters differ ( $P < 0.05$ ).

# Main findings in a trial with >1400 DanBred Hybrid gilts

## Results from first service

Herd A

Feeding curve	Normal	High
Age, days	233	232
Weight, kg	150 <sup>a</sup>	156 <sup>b</sup>
Back fat, mm	13.5 <sup>a</sup>	14.4 <sup>b</sup>
ADG in quarantine, g/day	<b>824<sup>a</sup></b>	<b>906<sup>b</sup></b>

Herd B

Feeding curve	Normal	High
Age, days	238	237
Weight, kg	161 <sup>a</sup>	166 <sup>b</sup>
Back fat, mm	14.0 <sup>a</sup>	14.9 <sup>b</sup>

<sup>a, b</sup> Within a row, values without common superscript letters differ ( $P < 0.05$ ).

# Main findings in a trial with >1400 DanBred Hybrid gilts

## Gilts mated in second parity

Herd A

Feeding curve	Normal	High
Gilts mated in 2 <sup>nd</sup> parity, %	97.1	94.8

Herd B

Feeding curve	Normal	High
Gilts mated in 2 <sup>nd</sup> parity, %	88.2	88.0

<sup>a, b</sup> Within a row, values without common superscript letters differ ( $P < 0.05$ ).

# Main findings in a trial with >1400 DanBred Hybrid gilts

## Looking at the 25 % lightest, 50 % medium and 25% heaviest gilts

Herd A

Feedingcurve	Light	Medium	Heavy
Age at 1 <sup>st</sup> service, days	230	230	241
Av. Weight at 1 <sup>st</sup> service, kg	136	153	173
Totalborn per litter, no	16.4 <sup>b</sup>	17.2 <sup>a</sup>	17.8 <sup>a</sup>
Gilts mated in 2 <sup>nd</sup> parity, %	97.1	94.5	97.2

a, b Within a row, values without common superscript letters differ ( $P < 0.05$ ).

Herd B

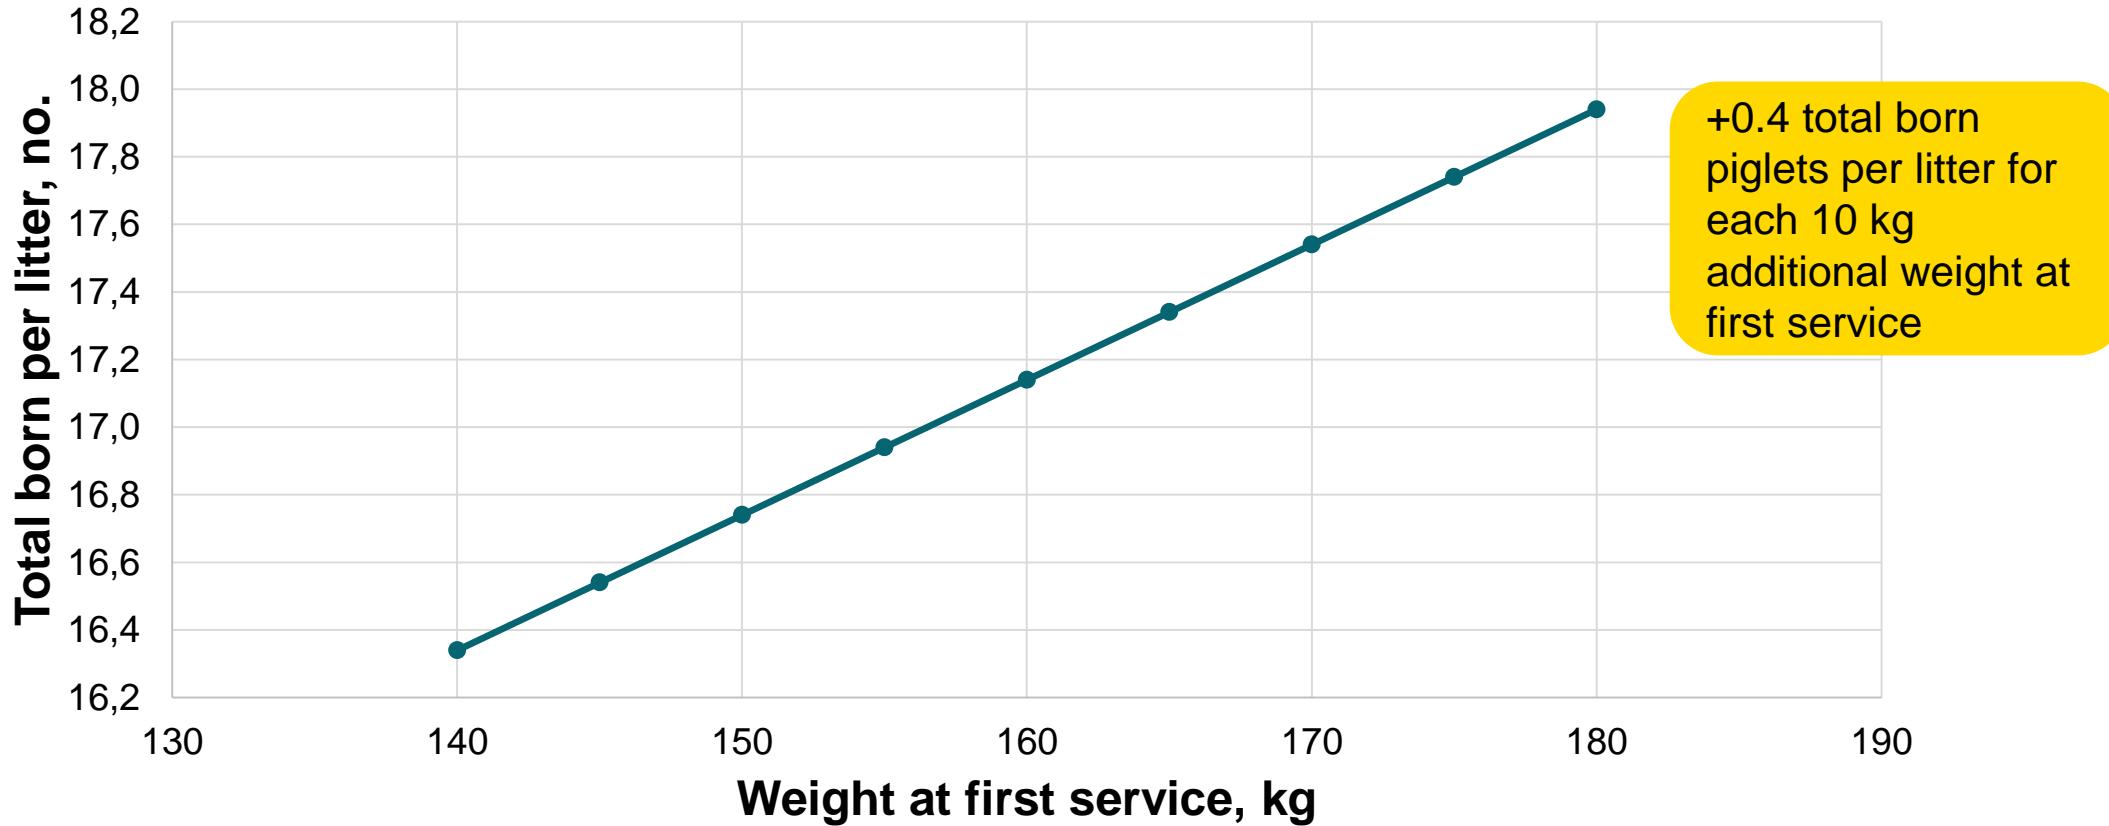

Feedingcurve	Light	Medium	Heavy
Age at 1 <sup>st</sup> service, days	229	233	256
Av. Weight at 1 <sup>st</sup> service, kg	140	161	187
Totalborn per litter, no	16.8 <sup>z</sup>	17.6 <sup>y</sup>	18.5 <sup>x</sup>
Gilts mated in 2 <sup>nd</sup> parity, %	92.5 <sup>x</sup>	91.5 <sup>x</sup>	77.4 <sup>y</sup>

x, y, z Within a row, values without common superscript letters differ ( $P < 0.05$ ).

Old/heavy gilts is  
an issue to  
consider...

# Merging data from the two herds

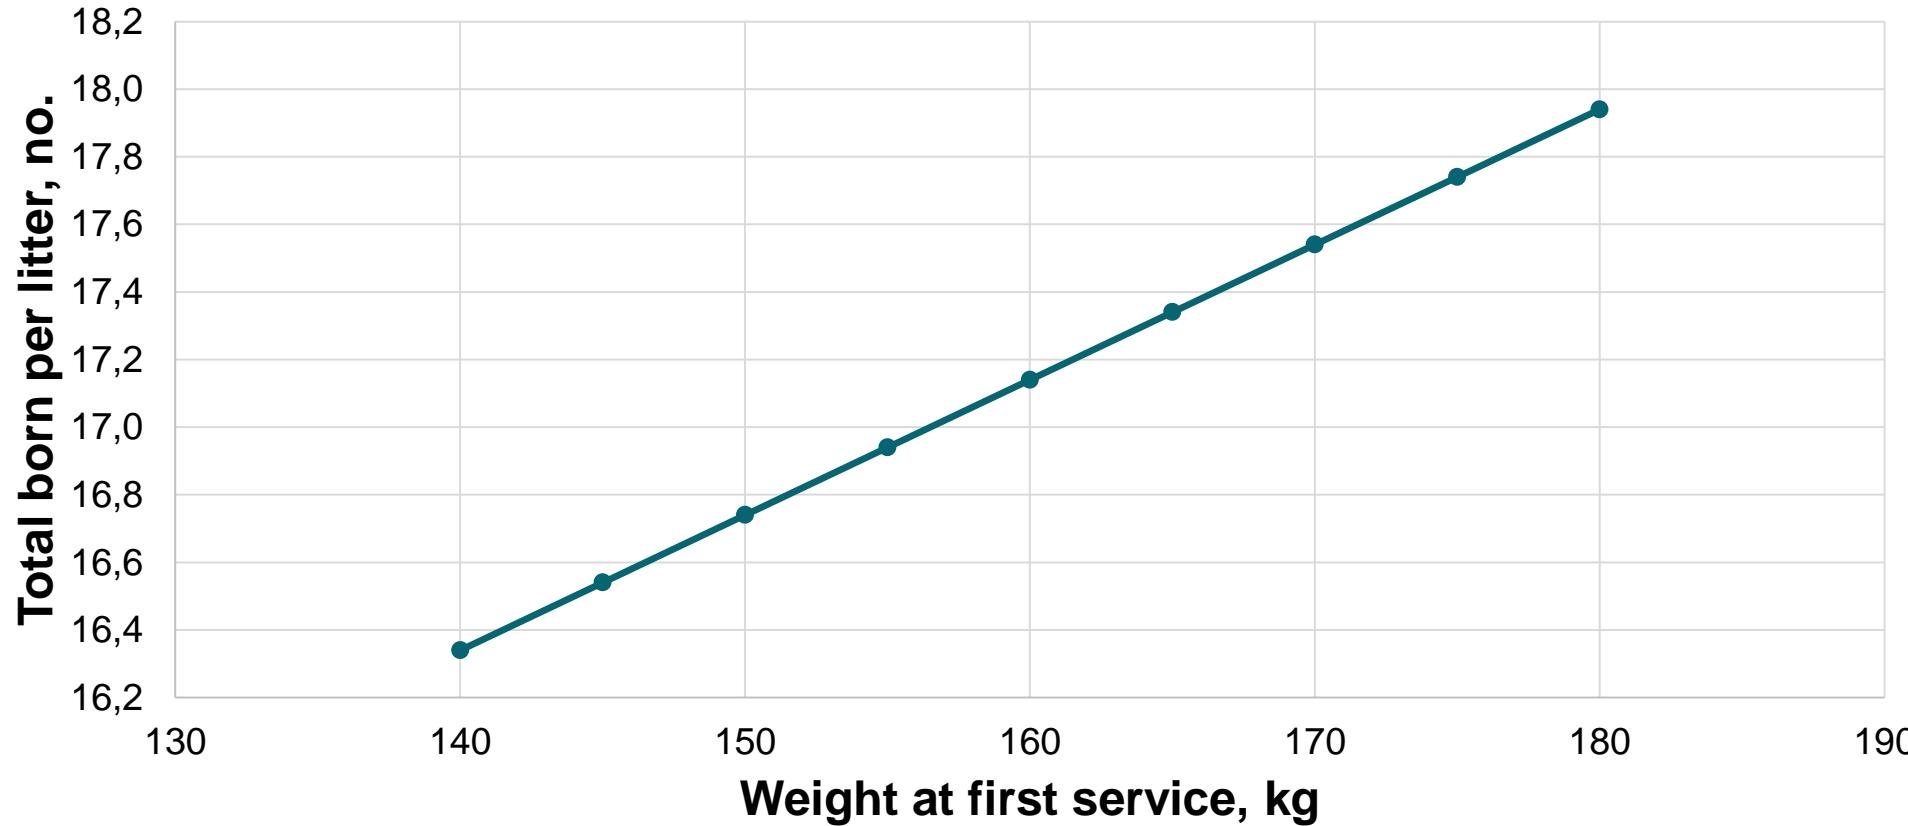

## What is most important when optimizing litter size?

# Agenda

Feeding during the rearing period

Introduction to the breeding unit

Flushing before first service

How do you make a difference?

Summary

# Entering the service unit

## A change from rearing conditions to reproductive conditions

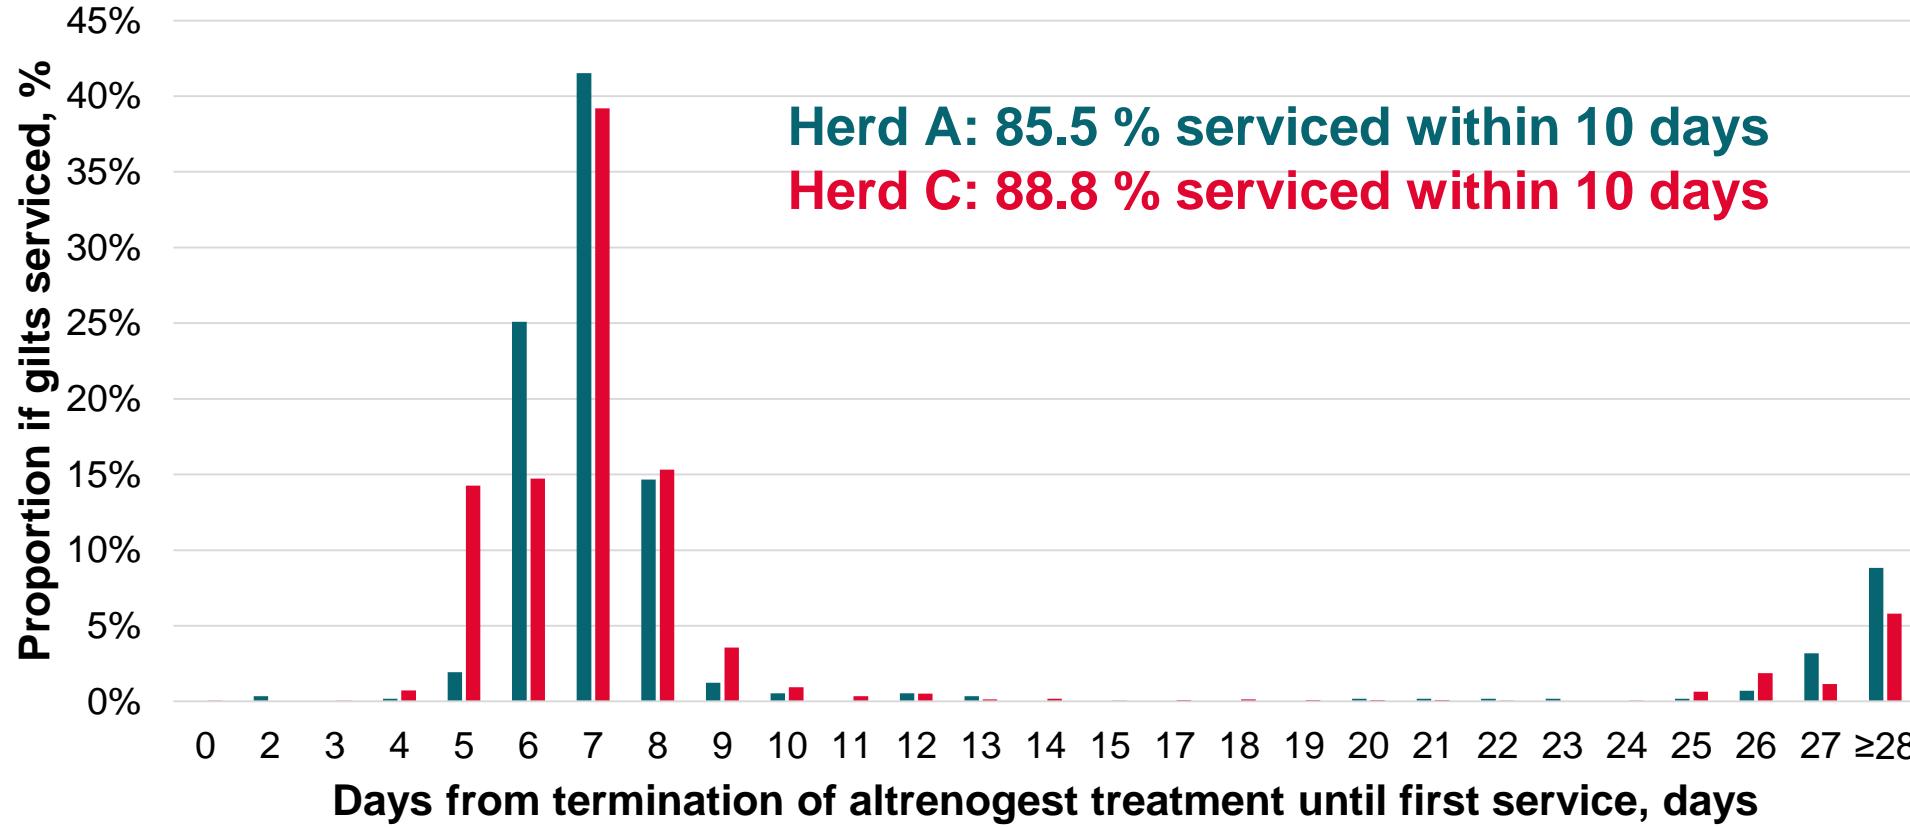

- Several significant changes for the gilt
  - New pen/environment
  - Change in feed composition
  - Presence of boars
    - Smell, sound, look
  - More frequent interactions with human

# Syncronizing the gilt second heat

## Caution at the different levels

- Step 1 (conditions when entering the breeding unit)
  - Age >190 days
  - Backfat >11-12 mm
  - Weight > 110 kg
- Step 2 (important tasks in the breeding unit)
  - Intensive boar contact to induce 1<sup>st</sup> heat
    - Boar on the pathways twice a day
  - Identify the 1<sup>st</sup> heat at each individual gilt
    - Mating should be done in 2<sup>nd</sup> heat (+1 total born piglet per litter)
    - Optimizing the flushing strategy (+0.4 total born piglet per litter)
- Step 3 (optional for further alignment )
  - Syncronization using altrenogest
  - Treatment should be given at the exact same time every day

# Agenda

Feeding during the rearing period

Introduction to the breeding unit

Flushing before first service

How do you make a difference?

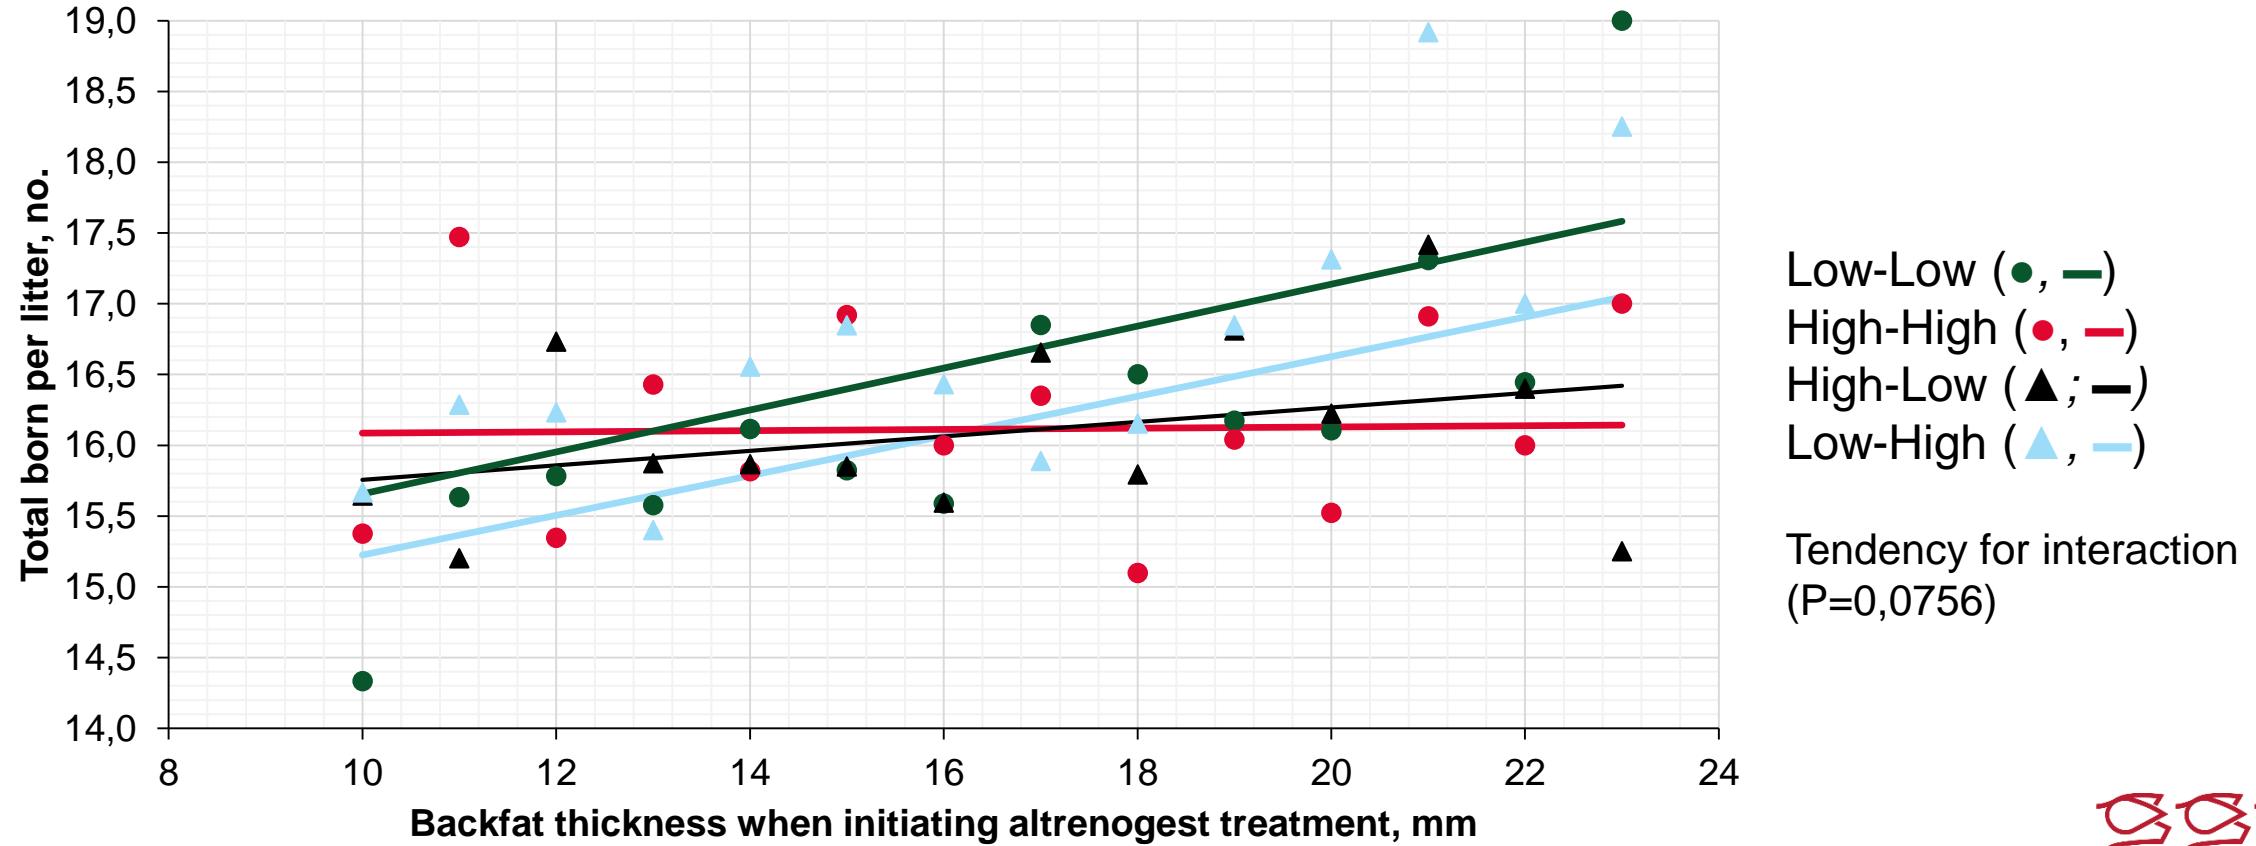

Summary

# Flushing makes sense but how?

- The general Danish recommendation
  - Flushing for 5-7 days before first service using around 3.5 kg feed/day
- Prerequisites for succes with flushing
  - No boar contact during the rearing period
  - Age > 190 days when entering the service unit
  - Weight >110 kg when entering the service unit
  - Backfat >12 mm when entering the service unit
- Flushing should be terminated when first service is done
- First service should be done in second heat (+1.0 total born piglet per litter)

# Flushing should take body condition into consideration

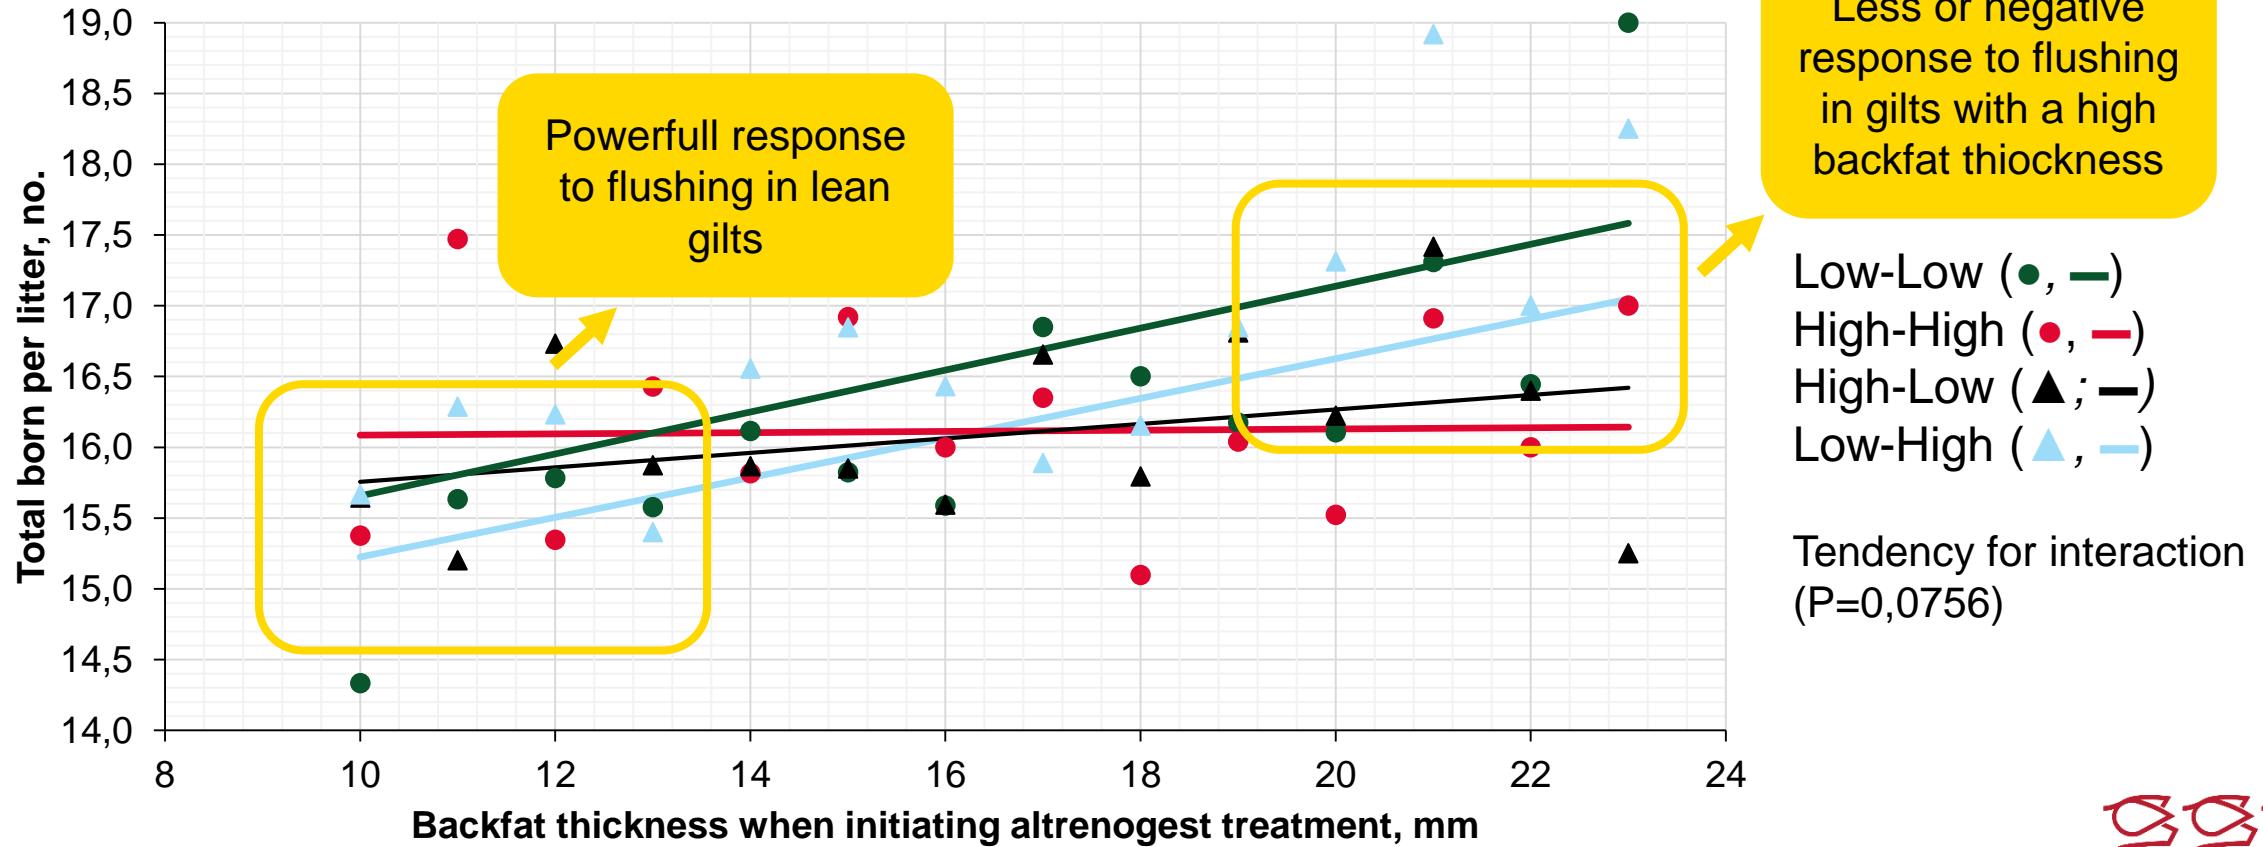

## The response to flushing is greater in lean gilts

Source: Bruun *et al.* (2020): Translational Animal Science (under review)

# Agenda

Feeding during the rearing period

Introduction to the breeding unit

Flushing before first service

How do you make a difference?

Summary

# Which gilts should enter the breeding unit? Your decision only...

Uniform gilts sorted by size and body condition BEFORE entering the breeding unit

Gilts moved pen by pen to the breeding unit WITHOUT any sorting BEFORE entering

# **Quality check and size selection at an average weight around 100 kg**

## To ensure an optimal "gilt flow" in the breeding unit

### **Fast growing gilts ⇒ move forward**

- First service at a younger age to control weight variation
- OK when looking at research results (weight vs. age)

### **Slow growing gilts ⇒ move to special care**

- 3.4 kg of feed with 3.6-4.2 g SID lysine/kg
- To ensure a higher body condition at the optimal weight at first service

# Agenda

Feeding during the rearing period

Introduction to the breeding unit

Flushing before first service

How do you make a difference?

Summary

# Summary

- Use the recommended nutrient contents and feeding curves
- Management is of great importance
  - Move fast growing gilts forward
  - Special care for slow growing gilts
- Optimal conditions when entering the breeding unit
  - Age >190 days
  - Backfat >11-12 mm
  - Weight > 110 kg
- Aims at first service in second heat
  - Age 230-240 days
  - Backfat 14-15 mm
  - Weight 140-160 kg
- Flushing for 5-7 days or +21 days dependent on body condition
